D R A F T

Common Criteria for Information Technology Security Evaluation

Part 3 : Security assurance requirements

19 December 1997

Version 2.0 Draft

CCIB-97/083R

D R A F T

Foreword

The CC Project Sponsoring Organisations are pleased to provide this **version 2.0 draft** of the *Common Criteria for Information Technology Security Evaluation*. This version is to be used by CC Project Sponsoring Organisations for their internal review. It will also be made available for information purposes to ISO/IEC, JTC 1, SC27/WG3 experts via the NIST website (see below). As previously agreed with WG3, the Common Criteria Implementation Board (CCIB) will continue to develop this document though early April, 1998. **Version 2.0 pre-final** will be released at that time, made available to WG 3 experts via the NIST website, and will also be provided in paper form at the WG3 meeting in Stockholm, Sweden.

Chapter 1

Introduction

1.1 Scope

1 Part 3 defines the assurance requirements of the CC. It includes the evaluation assurance levels (EALs) that define a scale for measuring assurance, the individual assurance components from which the assurance levels are composed, and the criteria for evaluation of PPs and STs.

1.2 Organisation of Part 3

2 Chapter 1 is the introduction and paradigm for Part 3.

3 Chapter 2 describes the presentation structure of the assurance classes, families, components, and evaluation assurance levels along with their relationships. It also characterises the assurance classes and families found in Chapter 5.

4 Chapter 3 provides a brief introduction to the evaluation criteria for PPs and STs, followed by detailed explanations of the families and components that are used for those evaluations.

5 Chapter 4 provides detailed definitions of the EALs.

6 Chapter 5 provides a brief introduction to the assurance classes and is followed by detailed definitions of those classes.

7 Chapter 6 provides a brief introduction to the evaluation criteria for maintenance of assurance, followed by detailed definitions of those families and components.

8 Annex A provides a summary of the dependencies between the assurance components.

9 Annex B provides a cross reference between the EALs and the assurance components.

10 Annex C provides the Common Criteria observation report guidance, example observations and example printed form.

1.3 CC assurance paradigm

11 The purpose of this section is to document the philosophy which underpins the CC approach to assurance. An understanding of this section will permit the reader to understand the rationale behind the CC assurance requirements.

D R A F T

1.3.1 CC philosophy

12 The CC philosophy is that the threats to security and organisational security policy commitments should be clearly articulated and the proposed security measures be demonstrably sufficient for their intended purpose.

13 Furthermore, measures should be adopted which facilitate the exposure and subsequent elimination of vulnerabilities. Should elimination be impractical, measures should be adopted which would detect any exploitation of the vulnerability and which minimise the impact of the exploitation.

1.3.2 Assurance approach

14 The CC philosophy is to gain and quantify assurance based upon an evaluation (active investigation) of the IT product or system which is to be trusted. Evaluation has been the traditional means of gaining assurance and is the basis for prior evaluation criteria documents. In aligning the existing approaches, the CC adopts the same philosophy. The CC proposes a measurement of assurance by expert evaluators with increasing emphasis on scope, depth and rigour.

15 The CC does not exclude, nor does it comment upon, the relative merits of other means of gaining assurance. Research continues with respect to alternative ways of gaining assurance. As mature alternative approaches emerge from these research activities, they will be considered for inclusion in the Common Criteria, which is so structured as to allow their future introduction.

1.3.2.1 Significance of vulnerabilities

16 It is assumed that there are threat agents that will actively seek and exploit the opportunity to make illicit gains arising out of breaches of security. Due to the need to process sensitive information and the lack of availability of sufficiently trusted products or systems, there is significant risk due to failures of IT. It is, therefore, likely that IT security breaches could lead to significant loss.

17 IT security breaches arise through the exploitation of vulnerabilities in the application of IT within business concerns.

18 Vulnerabilities within IT products and systems should therefore be exposed and, where feasible:

a) eliminated, that is active steps should be taken to remove or neutralise all known exploitable vulnerabilities;

b) minimised, that is active steps should be taken to reduce the impact of any exploitation of the vulnerability to an acceptable residual level;

c) monitored, that is active steps should be taken to ensure that any attempt to exploit a residual vulnerability will be detected so that steps can be taken to limit the damage.

1.3.2.2 Cause of vulnerabilities

19 Vulnerabilities can arise through failures in:

a) requirements, that is an IT product or system may possess all the functions and features required of it and still contain vulnerabilities which render it unsuitable or ineffective with respect to security;

b) construction, that is an IT product or system does not meet its specifications and vulnerabilities have been introduced as a result of poor constructional standards or incorrect design choices;

c) operation, that is an IT product or system has been constructed correctly to a correct specification but vulnerabilities have been introduced as a result of inadequate controls upon the operation.

1.3.2.3 CC assurance

20 Assurance is an attribute of an IT product or system which permits those depending on the IT product or system to have confidence that the security functions enforce the security policy. Assurance can be derived from reference to e.g. unsubstantiated assertions, prior relevant experience, or specific experience. However, the CC provides assurance through active investigation. Active investigation is an evaluation of the IT product or system in order to determine its security properties.

1.3.2.4 Assurance through evaluation

21 Evaluation has been the traditional means of gaining assurance, and is the basis of the CC approach. Evaluation techniques can include, but are not limited to:

a) analysis and checking of process(es) and procedure(s);

b) checking that process(es) and procedure(s) are being applied;

c) analysis of the correspondence between TOE design representations;

d) analysis of the TOE design representation against the requirements;

e) verification of mathematical proofs;

f) analysis of guidance documents;

g) analysis of functional tests developed and the results provided;

h) independent functional testing;

i) analysis for vulnerabilities (including flaw hypothesis);

j) penetration testing.

D R A F T

1.3.3 The CC evaluation assurance scale

22 The CC philosophy assumes that greater assurance results from the application of greater evaluation effort, and that the application of evaluation effort should be such as to maximise the assurance gains. The increasing evaluation effort is based upon:

a) scope, that is additional effort is deployed in evaluating a greater proportion of the IT product or system content;

b) depth, that is additional effort is deployed on evaluating greater design and implementation detail;

c) rigour, that is the additional effort is used to apply more searching tools and techniques in order to discover less obvious flaws or decrease the probability that such flaws remain.

D R A F T

Chapter 2

Security assurance requirements

2.1 Structures

23 The following sections describe the constructs used in representing the assurance classes, families, components, and EALs along with the relationships among them.

24 Figure 2.1 illustrates the assurance requirements defined in Part 3 of the CC. Note that the most abstract collection of assurance requirements is referred to as a class. Each class contains assurance families, which then contain assurance components, which in turn contain assurance elements.

2.1.1 Class structure

25 Figure 2.1 illustrates the assurance class structure.

2.1.1.1 Class name

26 Each assurance class is assigned a unique name. The name indicates the topics covered by the assurance class.

27 A unique short form of the assurance class name is also provided. This is the primary means for referencing the assurance class. The convention adopted is an “A” followed by two letters related to the class name.

2.1.1.2 Class introduction

28 Each assurance class has an introductory section which describes the composition of the class and contains supportive text covering the intent of the class.

D R A F T

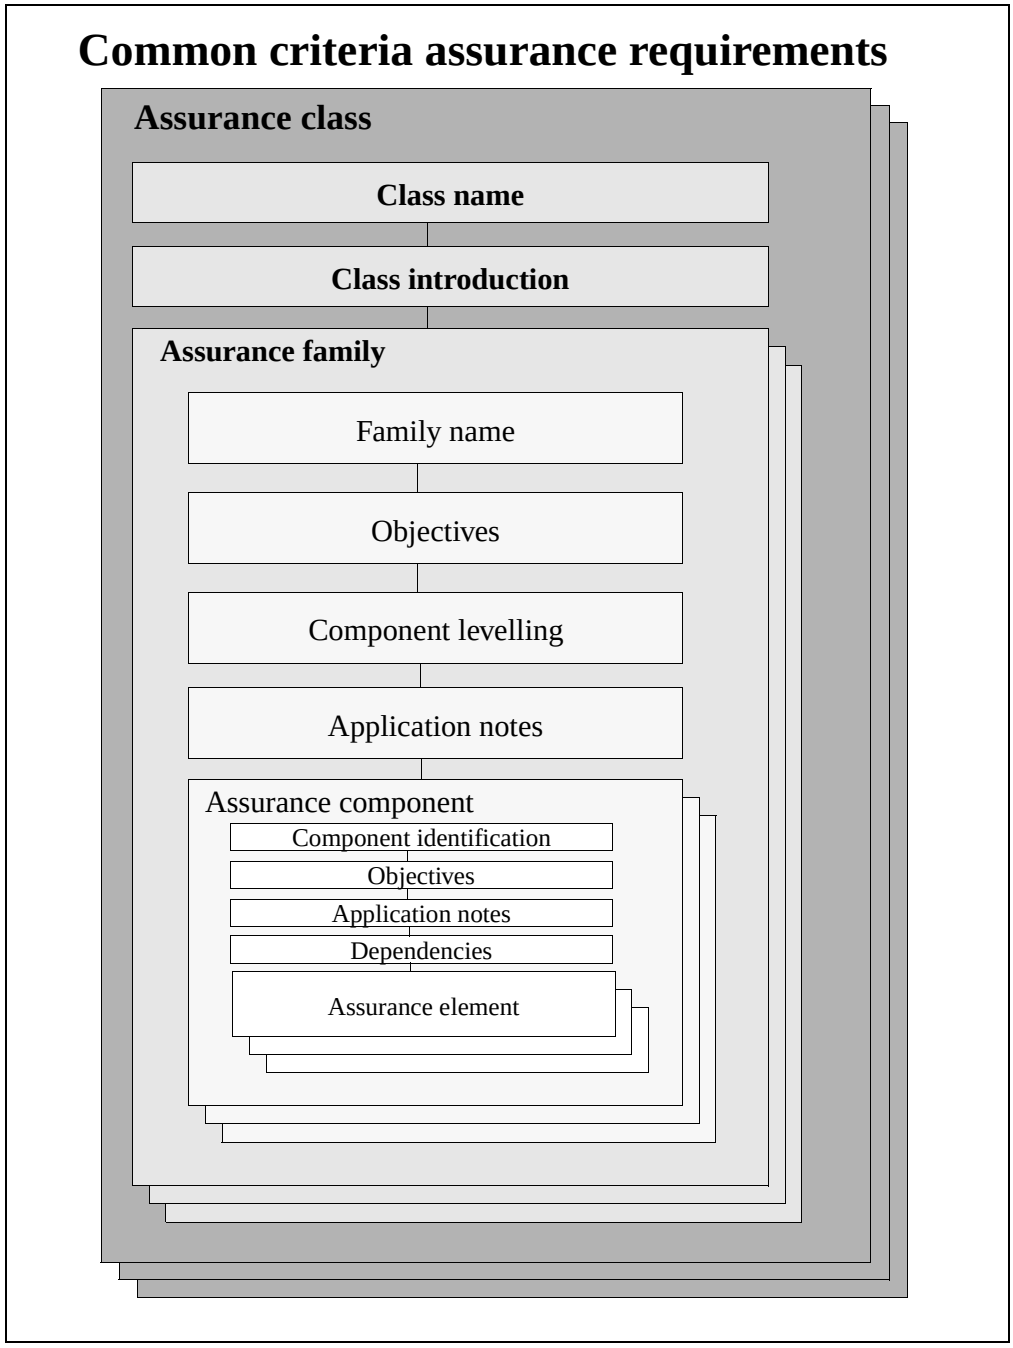

Figure 2.1 - Assurance class/family/component/element hierarchy

2.1.1.3 Assurance families

29 Each assurance class contains at least one assurance family. The structure of the assurance families is described in the following section.

D R A F T

2.1.2 Assurance family structure

30 Figure 2.1 illustrates the assurance family structure.

2.1.2.1 Family name

31 Every assurance family is assigned a unique name. The name provides descriptive information about the topics covered by the assurance family. Each assurance family is placed within the assurance class that contains other families with the same intent.

32 A unique short form of the assurance family name is also provided. This is the primary means used to reference the assurance family. The convention adopted is that the short form of the class name is used, followed by an underscore, and then three letters related to the family name.

2.1.2.2 Objectives

33 The objectives section of the assurance family presents the intent of the assurance family.

34 This section describes the objectives, particularly those related to the CC assurance paradigm, which the family is intended to address. The description for the assurance family is kept at a general level. Any specific details required for objectives are incorporated in the particular assurance component.

2.1.2.3 Component levelling

35 Each assurance family contains one or more assurance components. This section of the assurance family describes the components available and explains the distinctions between them. Its main purpose is to differentiate between the assurance components once it has been determined that the assurance family is a necessary or useful part of the assurance requirements for a PP/ST.

36 Assurance families containing more than one component are levelled and rationale is provided as to how the components are levelled. This rationale is in terms of scope, depth, and/or rigour.

2.1.2.4 Application notes

37 The application notes section of the assurance family, if present, contains additional information for the assurance family. This information should be of particular interest to users of the assurance family (e.g. PP and ST authors, designers of TOEs, evaluators). The presentation is informal and covers, for example, warnings about limitations of use and areas where specific attention may be required.

2.1.2.5 Assurance components

38 Each assurance family has at least one assurance component. The structure of the assurance components is provided in the following section.

D R A F T

2.1.3 Assurance component structure

39 Figure 2.2 illustrates the assurance component structure.

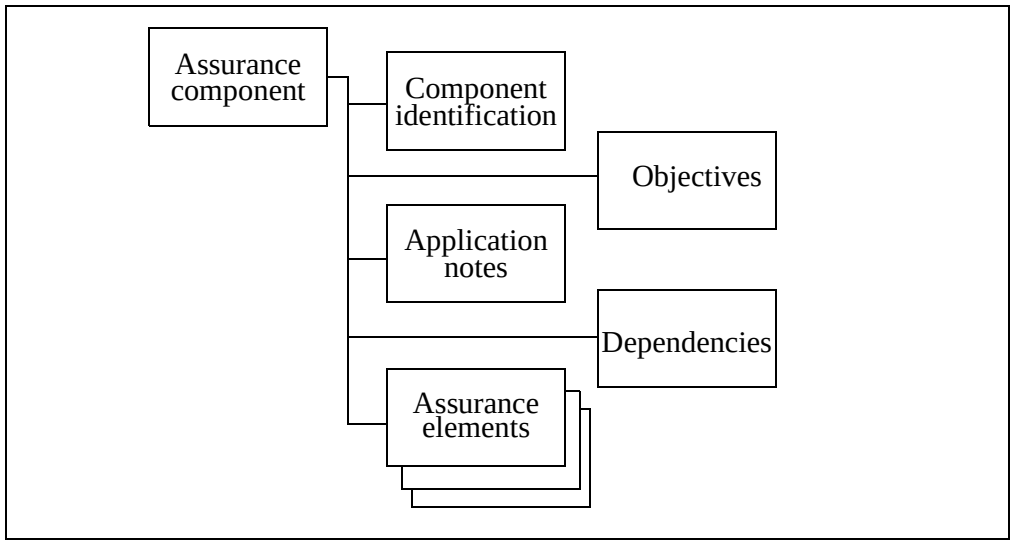

Figure 2.2 - Assurance component structure

40 The relationship between components within a family is highlighted using a bolding convention. Those parts of the requirements that are new, enhanced or modified beyond the requirements of the previous component within a hierarchy are bolded. The same bolding convention is also used for dependencies.

2.1.3.1 Component identification

41 The component identification section provides descriptive information necessary to identify, categorise, register, and reference a component.

42 Every assurance component is assigned a unique name. The name provides descriptive information about the topics covered by the assurance component. Each assurance component is placed within one assurance family that shares a common security objective.

43 A unique short form of the assurance component name is also provided. This is the primary means used to reference the assurance component. The convention used is that the short form of the family name is used, followed by a period, and then a numeric character. The numeric characters for the components within each family are assigned sequentially, starting from 1.

2.1.3.2 Objectives

44 The objectives section of the assurance component, if present, contains specific objectives for the particular assurance component. For those assurance components

that have this section, it contains the specific intent of the component and a more detailed explanation of the objectives.

2.1.3.3 Application notes

45 The application notes section of an assurance component, if present, contains additional information to facilitate the use of the component.

2.1.3.4 Dependencies

46 For each assurance component, there is a complete list of the dependencies on other assurance and functional components. “No dependencies” is used to describe the situation where no dependencies have been identified.

2.1.3.5 Assurance elements

47 A set of assurance elements is provided for each assurance component. An assurance element is a security requirement which if further divided would not yield a meaningful evaluation result. It is the smallest security requirement recognised in the CC.

48 Each assurance element is identified as belonging to one of the three sets of assurance elements:

a) Developer action elements: the activities that shall be performed by the developer. This set of actions is further qualified by evidential material referenced in the following set of elements. Requirements for developer actions are identified by appending the letter “D” to the element number.

b) Content and presentation of evidence elements: the evidence required, what the evidence shall demonstrate, and what information the evidence shall convey. Requirements for content and presentation of evidence are identified by appending the letter “C” to the element number.

c) Evaluator action elements: the activities that shall be performed by the evaluator. This set of actions implicitly includes confirmation that the requirements prescribed in the previous two sets of elements have been met, and includes actions or analysis which shall be performed in addition to that already performed by the developer. Requirements for evaluator actions are identified by appending the letter “E” to the element number.

49 The developer actions and content and presentation of evidence define the assurance requirements that are used to represent a developer’s responsibilities in demonstrating assurance in the TOE security functions. By meeting these requirements, the developer can increase confidence that the TOE satisfies the functional and assurance requirements of a PP or a ST.

50 The evaluator actions define the assurance requirements that represent a TOE evaluator’s responsibilities in verifying the security claims made in the TOE’s ST.

By meeting these requirements, the evaluator can increase confidence that the TOE satisfies the functional and assurance requirements of a PP or a ST.

51 Evaluator actions, combined with the requirements for content and presentation of evidence, identify the evaluator effort that shall be expended in verifying the security claims made in the ST of the TOE.

2.1.4 Assurance elements

52 Each element represents a requirement to be met. These statements of requirements are intended to be clear, concise, and unambiguous. Therefore, there are no compound sentences: each separable requirement is stated as an individual element.

53 The elements have been written using the normal dictionary meaning for the terms used, rather than using a number of predefined terms as shorthand which results in implicit requirements. Therefore, elements are written as explicit requirements, with *no reserved terms*.

54 In contrast to Part 2, neither assignment nor selection operations are relevant for elements in Part 3 of the CC; however, refinements may be made to Part 3 elements as required.

2.1.5 EAL structure

55 Figure 2.3 illustrates the EALs and associated structure defined in this Part 3. Note that while the figure shows the contents of the assurance components, it is intended that this information would be included by reference to the actual components defined in the CC.

2.1.5.1 EAL name

56 Each EAL is assigned a unique name. The name provides descriptive information about the intent of the EAL.

57 A unique short form of the EAL name is also provided. This is the primary means used to reference the EAL.

2.1.5.2 Objectives

58 The objectives section of the EAL presents the intent of the EAL.

2.1.5.3 Application notes

59 The application notes section of the EAL, if present, contains information of particular interest to users of the EAL (e.g. PP and ST authors, designers of TOEs targeting this EAL, evaluators). The presentation is informal and covers, for example, warnings about limitations of use and areas where specific attention may be required.

D R A F T

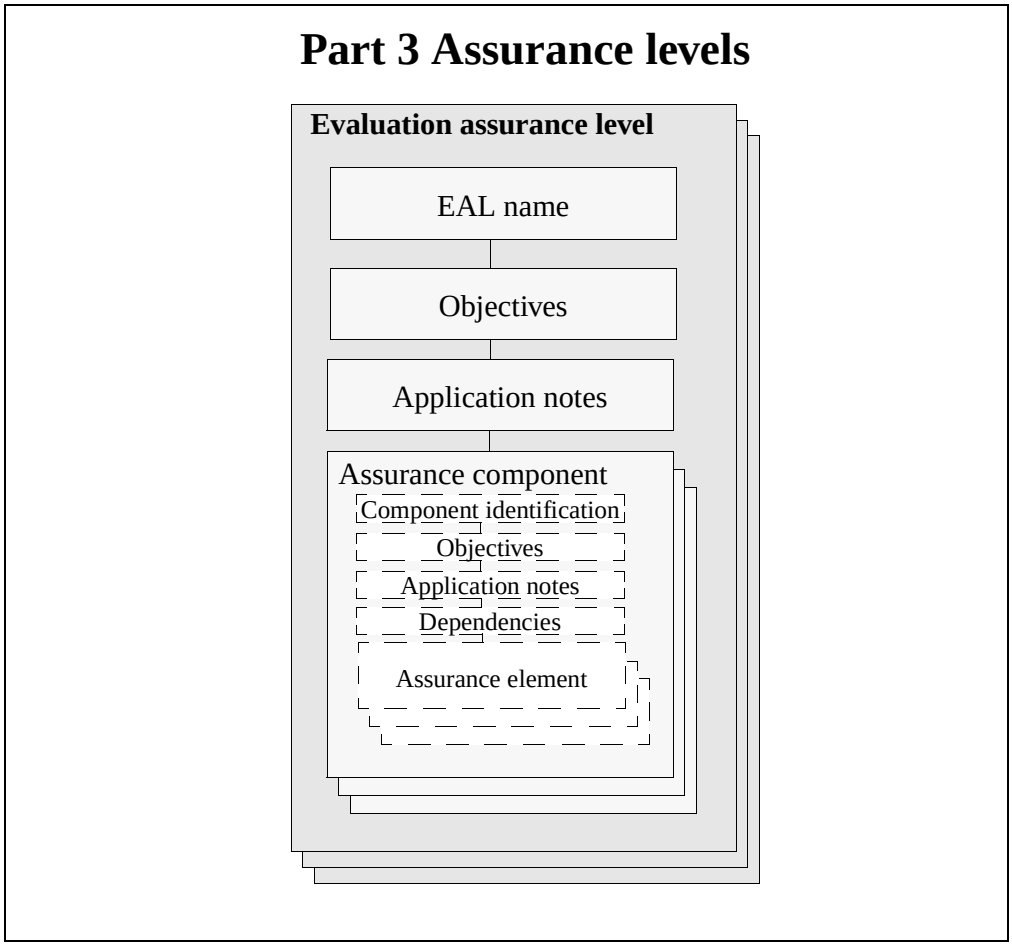

Figure 2.3 - EAL structure

D R A F T

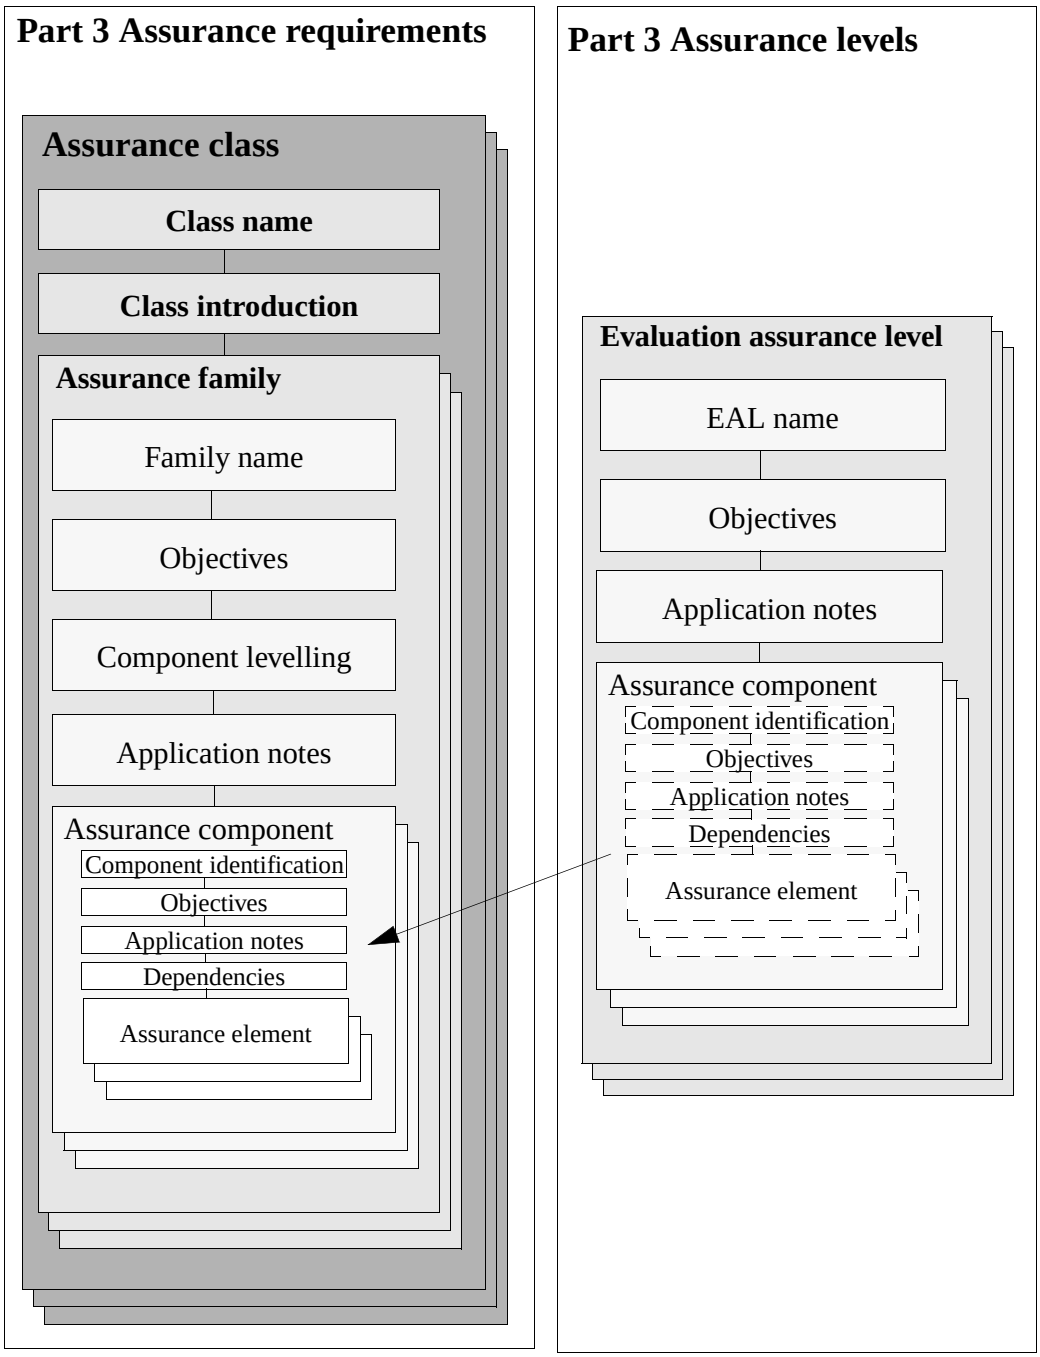

Figure 2.4 - Assurance and assurance level association

2.1.5.4 Assurance components

60 For each EAL the appropriate assurance components have been chosen.

D R A F T

61 A higher level of assurance than that provided by an EAL can be achieved by:

a) including additional assurance components from other assurance families; or

b) replacing an assurance component with a higher level assurance component from the same assurance family.

2.1.6 Relationship between assurances and assurance levels

62 Figure 2.3 illustrates the relationship between the assurance requirements and the assurance levels defined in Part 3. While assurance components further decompose into assurance elements, assurance elements cannot be individually referenced by assurance levels. Note that the arrow in the figure represents a reference from an EAL to an assurance component within the class where it is defined.

2.2 Component taxonomy

63 This Part 3 contains classes of families and components which are grouped on the basis of related assurance. At the start of each class is a diagram which indicates the families in the class and the components in each family.

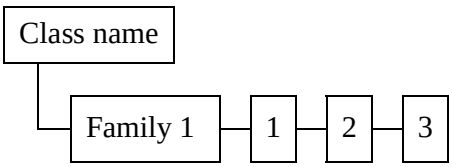

Figure 2.5 - Sample class decomposition diagram

64 In Figure 2.5, above, the class as shown contains a single family. The family contains three components that are linearly hierarchical (i.e. component 2 requires more than component 1, in terms of specific actions, specific evidence, or rigour of the actions or evidence). The assurance families in this Part 3 are all linearly hierarchical, though linearity is not a mandatory criterion for assurance families which may be added in the future.

2.3 Protection Profile and Security Target evaluation criteria class structure

65 The requirements for protection profile and security target evaluation are treated as assurance classes and are presented using the similar structure as that used for the other assurance classes, described below. One notable difference is the absence of a component levelling section in the associated family descriptions. The reason is that each family has only a single component and therefore no levelling has occurred.

D R A F T

2.4 Assurance categorisation

66 The assurance classes, families, and the abbreviation for each family are shown in Table 2.1.

Assurance Class	Assurance Family	Abbreviated Name
Configuration management	CM automation	ACM_AUT
	CM capabilities	ACM_CAP
	CM scope	ACM_SCP
Delivery and operation	Delivery	ADO_DEL
	Installation, generation, and start-up	ADO_IGS
Development	Functional specification	ADV_FSP
	High-level design	ADV_HLD
	Implementation representation	ADV_IMP
	TSF internals	ADV_INT
	Low-level design	ADV_LLD
	Representation correspondence	ADV_RCR
	Security policy modeling	ADV_SPM
Guidance documents	Administrator guidance	AGD_ADM
	User guidance	AGD_USR
Life cycle support	Development security	ALC_DVS
	Flaw remediation	ALC_FLR
	Life cycle definition	ALC_LCD
	Tools and techniques	ALC_TAT
Tests	Coverage	ATE_COV
	Depth	ATE_DPT
	Functional tests	ATE_FUN
	Independent testing	ATE_IND
Vulnerability assessment	Covert channel analysis	AVA_CCA
	Misuse	AVA_MSU
	Strength of TOE security functions	AVA_SOF
	Vulnerability analysis	AVA_VLA

Table 2.1 -Assurance family breakdown and mapping

2.5 Assurance class and family overview

67 The following summarises the assurance classes and families of Chapter 5. These classes and family summaries are presented in the same order as they appear in Chapter 5.

2.5.1 Configuration management (ACM)

68 Configuration management (CM) requires that the integrity of the TOE is adequately preserved. Specifically, configuration management provides confidence that the TOE and documentation used for evaluation are the ones prepared for distribution.

2.5.1.1 CM automation (ACM_AUT)

69 Configuration management automation establishes the level of automation used to control the configuration items.

2.5.1.2 CM capabilities (ACM_CAP)

70 Configuration management capabilities define the characteristics of the configuration management system.

2.5.1.3 CM scope (ACM_SCP)

71 Configuration management scope indicates the TOE items that need to be controlled by the configuration management system.

2.5.2 Delivery and operation (ADO)

72 Assurance class ADO defines requirements for the measures, procedures, and standards concerned with secure delivery, installation, and operational use of the TOE, ensuring that the security protection offered by the TOE is not compromised during transfer, installation, start-up, and operation.

2.5.2.1 Delivery (ADO_DEL)

73 Delivery covers the procedures used to maintain security during transfer of the TOE to the user, both on initial delivery and as part of subsequent modification. It includes special procedures or operations required to demonstrate the authenticity of the delivered TOE. Such procedures and measures are the basis for ensuring that the security protection offered by the TOE is not compromised during transfer. While compliance with the delivery requirements cannot be determined when a TOE is evaluated, it is possible to evaluate the procedures that a developer has developed to distribute the TOE to users.

74 This component is intended to counter the possibility that the TOE could be intentionally subverted during shipment from the development environment to the user’s site.

2.5.2.2 Installation, generation, and start-up (ADO_IGS)

75 Installation, generation, and start-up requires that the copy of the TOE is configured and activated by the administrator to exhibit the same protection properties as the master copy of the TOE. The installation, generation, and start-up procedures

provide confidence that the administrator will be aware of the TOE configuration parameters and how they can affect the TSF.

2.5.3 Development (ADV)

76 Assurance class ADV defines requirements for the stepwise refinement of the TSF from the TOE summary specification in the ST down to the actual implementation. Each of the resulting TSF representations provide information to help the evaluator determine whether the functional requirements of the TOE have been met.

2.5.3.1 Functional specification (ADV_FSP)

77 The functional specification describes the TSF, and must be a complete and accurate instantiation of the TOE security functional requirements. The functional specification also details the external interface to the TOE. Users of the TOE are expected to interact with the TSF through this interface.

2.5.3.2 High-level design (ADV_HLD)

78 The high-level design is a top level design specification that refines the TSF functional specification into the major constituent parts of the TSF. The high level design identifies the basic structure of the TSF and the major hardware, firmware, and software elements.

2.5.3.3 Implementation representation (ADV_IMP)

79 The implementation representation is the least abstract representation of the TSF. It captures the detailed internal workings of the TSF in terms of source code, hardware drawings, etc., as applicable.

2.5.3.4 TSF internals (ADV_INT)

80 The TSF internals are a set of requirements that constrain the internal structuring of the TSF.

2.5.3.5 Low-level design (ADV_LLD)

81 The low-level design is a detailed design specification that refines the high-level design into a level of detail that can be used as a basis for programming and/or hardware construction.

2.5.3.6 Representation correspondence (ADV_RCR)

82 The representation correspondence is a demonstration of mappings between all adjacent pairs of available TSF representations, from the TOE summary specification through to the least abstract TSF representation that is provided.

2.5.3.7 Security policy modeling (ADV_SPM)

83 Security policy models are mathematical representations of security policies of the TSP, and are used to provide increased assurance that the functional specification corresponds to the security policies of the TSP, and ultimately to the TOE security functional requirements. This is achieved via correspondence mappings between the functional specification, the security policy model, and the security policies that are modelled.

2.5.4 Guidance documents (AGD)

84 Assurance class AGD defines requirements directed at the understandability, coverage and completeness of the operational documentation provided by the developer. This documentation which provides two categories of information, for end users and for administrators, is an important factor in the secure operation of the TOE.

2.5.4.1 Administrator guidance (AGD_ADM)

85 Requirements for administrative guidance help ensure that the environmental constraints are understood by administrators and operators of the TOE. Administrative guidance is the primary means available to the developer for providing the TOE administrators with detailed, accurate information of how to administer the TOE in a secure manner and how to make effective use of the TSF privileges and protection functions.

2.5.4.2 User guidance (AGD_USR)

86 Requirements for user guidance help ensure that users are able to operate the TOE in a secure manner (e.g. the usage constraints assumed by the PP or ST must be clearly explained and illustrated). User guidance is the primary vehicle available to the developer for providing the TOE users with the necessary background and specific information on how to correctly use the TOE's protection functions. User guidance must do two things. First, it needs to explain how the user-visible security functions work, so that users are able to consistently and effectively protect their information. Second, it needs to explain the user's role in maintaining the TOE's security.

2.5.5 Life cycle support (ALC)

87 Assurance class ALC defines requirements for assurance provided in the security of the TOE by the adoption of a well defined life-cycle model for all the steps of the TOE development, including flaw remediation procedures and policies, correct use of tools and techniques and the security measures used to protect the development environment.

2.5.5.1 Development security (ALC_DVS)

88 Development security covers the physical, procedural, personnel, and other security measures used in the development environment. It includes physical security of the

development location(s) and controls on the selection and hiring of development staff.

2.5.5.2 Flaw remediation (ALC_FLR)

89 A part of life cycle support is flaw remediation. Flaw remediation ensures that flaws discovered by the TOE consumers will be tracked and corrected while the TOE is supported by the developer. While compliance with the flaw remediation requirements cannot be determined when a TOE is evaluated, it is possible to evaluate the procedures and policies that a developer has in place to track and repair flaws, and to distribute the repairs to consumers.

2.5.5.3 Life cycle definition (ALC_LCD)

90 Life cycle definition establishes that the engineering practices used by a developer to produce the TOE include the considerations and activities identified in the development process and operational support requirements. Confidence in the correspondence between the requirements and the TOE is greater when security analysis and the production of evidence are done on a regular basis as an integral part of the development process and operational support activities. It is not the intent of this component to dictate any specific development process.

2.5.5.4 Tools and techniques (ALC_TAT)

91 Tools and techniques addresses the need to define the development tools being used to analyse and implement the TOE. It includes requirements concerning the development tools and implementation dependent options of those tools.

2.5.6 Tests (ATE)

92 Assurance class ATE states requirements for testing which demonstrate that the TSF satisfies at least the security functional requirements.

2.5.6.1 Coverage (ATE_COV)

93 Coverage deals with the completeness of the functional tests performed on the TOE. It addresses the extent to which the TOE security functions are tested.

2.5.6.2 Depth (ATE_DPT)

94 Depth deals with the level of detail to which the TOE is tested. Testing of security functions is based upon increasing depth of information derived from analysis of the representations.

2.5.6.3 Functional tests (ATE_FUN)

95 Functional testing establishes that the TSF exhibits the properties necessary to satisfy the requirements of its PP and ST. Functional testing provides assurance that the TSF satisfies at least the requirements of the chosen functional components. However, functional tests do not establish that the TSF does no more than expected.

2.5.6.4 Independent testing (ATE_IND)

96 Independent testing specifies the degree to which the functional testing of the TOE must be performed by a party other than the developer (e.g. a third party). This family adds value by the introduction of tests that are not part of the developers tests.

2.5.7 Vulnerability assessment (AVA)

97 Assurance class AVA defines requirements directed at the identification of exploitable vulnerabilities. Specifically, it addresses those vulnerabilities introduced in the construction, operation, misuse, or incorrect configuration of the TOE.

2.5.7.1 Covert channel analysis (AVA_CCA)

98 Covert channel analysis is directed towards the discovery and analysis of unintended communications channels that can be exploited to violate the intended TSP.

2.5.7.2 Misuse (AVA_MSU)

99 This aspect of vulnerability assessment investigates whether the TOE can be configured or used in a manner that is insecure, but that an administrator or end-user of the TOE would reasonably believe to be secure.

2.5.7.3 Strength of TOE security functions (AVA_SOF)

100 Even if a TOE security function cannot be bypassed, deactivated, or corrupted, it may still be possible to defeat it. For these functions, it is possible to make a claim for the strength of each one. For example, a password mechanism cannot prevent the guessing of unknown passwords, but its strength can be increased by making the password space larger.

2.5.7.4 Vulnerability analysis (AVA_VLA)

101 This analysis of the TSF consists of the identification of flaws potentially introduced in the different refinement steps of the development. It results in the definition of penetration tests through the collection of the necessary information concerning: (1) the completeness of the TSF (does the TSF counter all the postulated threats?) and (2) the dependencies between all security functions. These known vulnerabilities are assessed through penetration testing to determine whether they could, in practice, be exploitable to compromise the security of the TOE.

2.6 Maintenance categorisation

102 The requirements for the maintenance of assurance are treated as an assurance class and are presented using the class structure defined above.

103 The maintenance of assurance families, and the abbreviation for each family are shown in Table 2.2.

Assurance Class	Assurance Family	Abbreviated Name
Maintenance of assurance	Assurance maintenance plan	AMA_AMP
	TOE component categorisation report	AMA_CAT
	Evidence of assurance maintenance	AMA_EVD
	Security impact analysis	AMA_SIA

Table 2.2 -Maintenance of assurance class decomposition

2.7 Maintenance of assurance class and family overview

104 The following summarises the assurance class and families of Chapter 6. The class and family summaries are presented in the same order as they appear in Chapter 6.

2.7.1 Maintenance of assurance (AMA)

105 Maintenance of assurance is aimed at maintaining the level of assurance that the TOE will continue to meet its security target as changes are made to the TOE or its environment. Each of the families in this class identifies developer and evaluator actions which are to be applied *after* the TOE has been successfully evaluated, although some requirements can be applied at the time of the evaluation.

2.7.1.1 Assurance maintenance plan (AMA_AMP)

106 The assurance maintenance plan identifies the plans and procedures a developer must implement in order to ensure that the assurance that was established in the evaluated TOE is maintained as changes are made to the TOE or its environment.

2.7.1.2 TOE component categorisation report (AMA_CAT)

107 The TOE component categorisation report provides a categorisation of the components of a TOE (e.g. TSF subsystems) according to their relevance to security. This categorisation acts as a focus for the developer’s security impact analysis.

2.7.1.3 Evidence of assurance maintenance (AMA_EVD)

108 This family defines the requirements which seek to establish confidence that the assurance is being maintained by the developer, in accordance with the assurance maintenance plan.

2.7.1.4 Security impact analysis (AMA_SIA)

109 This family defines the requirements which seek to establish confidence that assurance has been maintained in the TOE, through an analysis performed by the developer of the security impact of all changes affecting the TOE since it was evaluated.

Chapter 3

Protection Profile and Security Target evaluation criteria

3.1 Overview

110 This chapter presents the evaluation criteria for PPs and STs. The PP evaluation criteria are presented in the "Class APE" and the ST evaluation criteria are presented in the "Class ASE".

111 These criteria are the first requirements presented in this part because the PP and ST evaluation will normally be performed before the TOE evaluation. They play a special role in that information about the TOE is assessed and the functional and assurance requirements are evaluated in order to find out whether the PP or ST is a meaningful basis for a TOE evaluation.

112 Although these evaluation criteria differ somewhat from the requirements in Chapter 5, they are presented in a similar manner because the developer and evaluator activities are comparable for the PP evaluation, the ST evaluation and the TOE evaluation.

113 The classes in this chapter differ from those in Chapter 5 in that all requirements in the respective class need to be considered for a PP or ST evaluation, whereas the requirements presented in Chapter 5 allow selection.

3.2 Protection Profile criteria overview

3.2.1 Protection Profile evaluation

114 The goal of a PP evaluation is to demonstrate that the PP is complete, consistent, technically sound, and hence suitable for use as a statement of requirements for an evaluatable TOE. Such a PP may be eligible for inclusion within a PP register.

3.2.2 Relation to the Security Target evaluation criteria

115 As described in Part 1, Annexes B and C, there are many similarities in structure and content between the generic PP and the TOE-specific ST. Consequently, the criteria for evaluating PPs contain requirements that are similar to many of those for STs, and the criteria for both are presented in a similar manner.

-

3.2.3 Evaluator tasks

3.2.3.1 Evaluator tasks for an evaluation based on CC requirements only

116 Evaluators performing a PP evaluation which does not include requirements from outside the CC shall apply the requirements of the APE class as described in Table 3.1.

Class	Family	Abbreviated Name
Protection Profile evaluation	Protection Profile, TOE Description	APE_DES
	Protection Profile, Security Environment	APE_ENV
	Protection Profile, PP Introduction	APE_INT
	Protection Profile, Security Objectives	APE_OBJ
	Protection Profile, TOE Security Requirements	APE_REQ

Table 3.1 - Protection Profile families - only CC requirements

3.2.3.2 Evaluator tasks for a CC extended evaluation

117 Evaluators performing a PP evaluation which includes requirements from outside the CC shall apply the requirements of the APE class as described in Table 3.2.

Class	Family	Abbreviated Name
Protection Profile evaluation	Protection Profile, TOE Description	APE_DES
	Protection Profile, Security Environment	APE_ENV
	Protection Profile, PP Introduction	APE_INT
	Protection Profile, Security Objectives	APE_OBJ
	Protection Profile, TOE Security Requirements	APE_REQ
	Protection Profile, Explicitly Stated TOE Security Requirements	**APE_SRE**

Table 3.2 - Protection Profile families - CC extended requirements

3.3 Security Target criteria overview

3.3.1 Security Target evaluation

118 The goal of an ST evaluation is to demonstrate that the ST is complete, consistent, technically sound, and hence suitable for use as the basis for the corresponding TOE evaluation.

3.3.2 Relation to the other evaluation criteria in this Part

119 There are two identified stages for the evaluation of a TOE; the ST evaluation and the corresponding TOE evaluation. The requirements for the ST evaluation are

contained in this chapter, and the requirements for the TOE evaluation are contained in Chapters 4 and 5.

120 The ST evaluation includes a PP claims evaluation. If the ST does not claim PP conformance, the PP claims part of the ST shall contain a statement that the TOE does not claim conformance to any PP.

3.3.3 Evaluator tasks

3.3.3.1 Evaluator tasks for an evaluation based on CC requirements only

121 Evaluators performing an ST evaluation which does not include requirements from outside the CC shall apply the requirements of the ASE class as described in Table 3.3.

Class	Family	Abbreviated Name
Security Target evaluation	Security Target, TOE Description	ASE_DES
	Security Target, Security Environment	ASE_ENV
	Security Target, ST Introduction	ASE_INT
	Security Target, Security Objectives	ASE_OBJ
	Security Target, PP Claims	ASE_PPC
	Security Target, TOE Security Requirements	ASE_REQ
	Security Target, TOE Summary Specification	ASE_TSS

Table 3.3 - Security Target families - only CC requirements

3.3.3.2 Evaluator tasks for a CC extended evaluation

122 Evaluators performing an ST evaluation which includes requirements from outside the CC shall apply the requirements of the ASE class as described in Table 3.4.

Class	Family	Abbreviated Name
Security Target evaluation	Security Target, TOE Description	ASE_DES
	Security Target, Security Environment	ASE_ENV
	Security Target, ST Introduction	ASE_INT
	Security Target, Security Objectives	ASE_OBJ
	Security Target, PP Claims	ASE_PPC
	Security Target, TOE Security Requirements	ASE_REQ
	Security Target, Explicitly Stated TOE Security Requirements	**ASE_SRE**
	Security Target, TOE Summary Specification	ASE_TSS

Table 3.4 - Security Target families - CC extended requirements

-

Class APE

Protection Profile evaluation

123 The goal of a PP evaluation is to demonstrate that the PP is complete, consistent and technically sound. An evaluated PP is suitable for use as the basis for the development of STs. Such a PP is eligible for inclusion in a registry.

124 Figure 3.1 shows the families within this class.

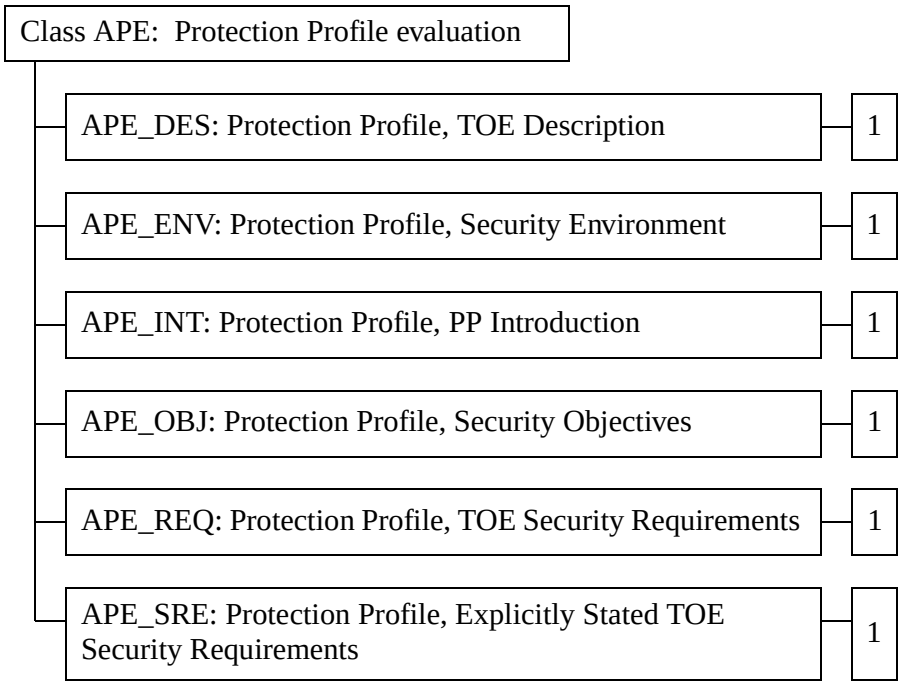

Figure 3.1 - Protection Profile evaluation class decomposition

APE_DES Protection Profile, TOE Description

Objectives

125 The TOE description is an aid to the understanding of the TOE's security requirements. Evaluation of the TOE description is required to show that it is coherent and internally consistent and that it is consistent with all other parts of the PP.

APE_DES.1 Protection Profile, TOE Description, Evaluation Requirements

Dependencies:

APE_ENV.1 Protection Profile, Security Environment, Evaluation Requirements

APE_INT.1 Protection Profile, PP Introduction, Evaluation Requirements

APE_OBJ.1 Protection Profile, Security Objectives, Evaluation Requirements

APE_REQ.1 Protection Profile, TOE Security Requirements, Evaluation Requirements

APE_SRE.1 Protection Profile, Explicitly Stated TOE Security Requirements, Evaluation Requirements

Developer action elements:

APE_DES.1.1D **The PP developer shall provide a TOE Description as part of the PP.**

Content and presentation of evidence elements:

APE_DES.1.1C **The TOE description shall as a minimum describe the product type and the general IT features of the TOE.**

Evaluator action elements:

APE_DES.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

APE_DES.1.2E **The evaluator shall confirm that the TOE description is coherent and internally consistent.**

APE_DES.1.3E **The evaluator shall confirm that the TOE description is consistent with the other parts of the PP.**

APE_ENV Protection Profile, Security Environment

Objectives

126 In order to determine whether the IT security requirements in the PP are sufficient, it is important that the security problem to be solved is clearly understood by all parties to the evaluation.

APE_ENV.1 Protection Profile, Security Environment, Evaluation Requirements

Dependencies:

No dependencies.

Developer action elements:

APE_ENV.1.1D **The PP developer shall provide a statement of TOE security environment as part of the PP.**

Content and presentation of evidence elements:

APE_ENV.1.1C **The statement of TOE security environment shall identify and explain any assumptions about the intended usage of the TOE and the environment of use of the TOE. These shall include as a minimum assumptions regarding the physical, personnel, and connectivity aspects of that environment.**

APE_ENV.1.2C **The statement of TOE security environment shall identify and explain any known or presumed threats to the assets against which protection will be required, either by the TOE or by its environment.**

APE_ENV.1.3C **The statement of TOE security environment shall identify and explain any organisational security policies that the TOE must comply with.**

Evaluator action elements:

APE_ENV.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

APE_ENV.1.2E **The evaluator shall confirm that the statement of TOE security environment is coherent and internally consistent.**

APE_INT Protection Profile, PP Introduction

Objectives

127 The PP introduction contains document management and overview information necessary to operate a PP registry. Evaluation of the PP introduction is required to demonstrate that the PP is correctly identified and that it is consistent with all other parts of the PP.

APE_INT.1 Protection Profile, PP Introduction, Evaluation Requirements

Dependencies:

APE_DES.1 Protection Profile, TOE Description, Evaluation Requirements

APE_ENV.1 Protection Profile, Security Environment, Evaluation Requirements

APE_OBJ.1 Protection Profile, Security Objectives, Evaluation Requirements

APE_REQ.1 Protection Profile, TOE Security Requirements, Evaluation Requirements

APE_SRE.1 Protection Profile, Explicitly Stated TOE Security Requirements, Evaluation Requirements

Developer action elements:

APE_INT.1.1D **The PP developer shall provide a PP introduction as part of the PP.**

Content and presentation of evidence elements:

APE_INT.1.1C **The PP introduction shall contain a PP identification which provides the labelling and descriptive information necessary to identify, catalogue, register, and cross reference the PP.**

APE_INT.1.2C **The PP introduction shall contain a PP overview which summarises the PP in narrative form.**

Evaluator action elements:

APE_INT.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

APE_INT.1.2E **The evaluator shall confirm that the PP introduction is coherent and internally consistent.**

APE_INT.1.3E **The evaluator shall confirm that the PP introduction is consistent with the other parts of the PP.**

APE_OBJ Protection Profile, Security Objectives

Objectives

128 The security objectives is a concise statement of the intended response to the security problem. Evaluation of the security objectives is required to demonstrate that the stated objectives adequately address the security problem. The security objectives are categorised as security objectives for the TOE and security objectives for the environment. The security objectives for both the TOE and the environment must be shown to be traced back to the identified threats to be countered and/or policies and assumptions to be met by each.

APE_OBJ.1 Protection Profile, Security Objectives, Evaluation Requirements

Dependencies:

APE_ENV.1 Protection Profile, Security Environment, Evaluation Requirements

Developer action elements:

APE_OBJ.1.1D **The PP developer shall provide a statement of security objectives as part of the PP.**

APE_OBJ.1.2D **The PP developer shall provide the security objectives rationale.**

Content and presentation of evidence elements:

APE_OBJ.1.1C **The statement of security objectives shall define the security objectives for the TOE and its environment.**

APE_OBJ.1.2C **The security objectives for the TOE shall be clearly stated and traced back to the identified threats to be countered and/or organisational security policies to be met by the TOE.**

APE_OBJ.1.3C **The security objectives for the environment shall be clearly stated and traced back to the identified threats to be countered and/or organisational security policies or assumptions to be met in the TOE's environment.**

APE_OBJ.1.4C **The security objectives rationale shall demonstrate that the stated security objectives are suitable to counter the identified threats to security.**

APE_OBJ.1.5C **The security objectives rationale shall demonstrate that the stated security objectives are suitable to cover all of the identified organisational security policies and assumptions.**

Evaluator action elements:

APE_OBJ.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

APE_OBJ.1.2E **The evaluator shall confirm that the statement of security objectives is complete, coherent, and internally consistent.**

APE_REQ Protection Profile, TOE Security Requirements

Objectives

129 The IT security requirements chosen for a TOE and presented or cited in a PP need to be evaluated in order to confirm that they are internally consistent and lead to the development of a TOE which will meet its security objectives.

130 Not all of the IT security objectives expressed in a PP may be met by a compliant TOE. So some TOEs may depend on certain IT security requirements to be met by the IT environment. When this is the case, the environmental IT security requirements must be clearly stated and evaluated in context with the TOE requirements.

131 This family presents evaluation requirements which permit the evaluator to determine that a PP is suitable for use as a statement of requirements for an evaluatable TOE. The additional criteria necessary for the evaluation of explicitly stated requirements is covered in the APE_SRE family.

Application notes

132 "TOE security requirements" refers to "TOE security functional requirements" and/or "TOE security assurance requirements."

APE_REQ.1 Protection Profile, TOE Security Requirements, Evaluation Requirements

Dependencies:

APE_OBJ.1 Protection Profile, Security Objectives, Evaluation Requirements

Developer action elements:

APE_REQ.1.1D **The PP developer shall provide a statement of TOE security functional requirements and a statement of TOE security assurance requirements as part of the PP.**

APE_REQ.1.2D **The PP developer shall provide the security requirements rationale.**

Content and presentation of evidence elements:

APE_REQ.1.1C **The statement of TOE security functional requirements shall identify the TOE security functional requirements drawn from CC Part 2 functional requirements components.**

APE_REQ.1.2C **The statement of TOE security assurance requirements shall identify the TOE security assurance requirements drawn from CC Part 3 assurance requirements components.**

APE_REQ.1.3C **The statement of TOE security assurance requirements should include a CC Evaluation Assurance Level (EAL) as defined in CC Part 3.**

APE_REQ.1.4C **The evidence shall justify that the statement of TOE security assurance requirements is appropriate.**

APE_REQ.1.5C **The PP shall, if appropriate, identify any security requirements for the IT environment.**

APE_REQ.1.6C **All completed operations on TOE security requirements included in the PP shall be identified.**

APE_REQ.1.7C **Any uncompleted operations on TOE security requirements included in the PP shall be identified.**

APE_REQ.1.8C **Dependencies among the TOE security requirements included in the PP should be satisfied.**

APE_REQ.1.9C **The evidence shall justify why any non-satisfaction of dependencies is appropriate.**

APE_REQ.1.10C **The PP shall include a statement of the minimum strength of function level for the TOE security functional requirements, either SOF-basic, SOF-medium or SOF-high, as appropriate.**

APE_REQ.1.11C **The PP shall identify any specific TOE security functional requirements for which an explicit strength of function is appropriate, together with the specific metric.**

APE_REQ.1.12C **The security requirements rationale shall demonstrate that the minimum strength of function level for the PP together with any explicit strength of function claim is consistent with the security objectives for the TOE.**

APE_REQ.1.13C **The security requirements rationale shall demonstrate that the TOE security requirements are suitable to meet all of the security objectives for the TOE.**

APE_REQ.1.14C **The security requirements rationale shall demonstrate that the set of TOE security requirements together forms a mutually supportive and internally consistent whole.**

Evaluator action elements:

APE_REQ.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

APE_REQ.1.2E **The evaluator shall confirm that the statement TOE security functional requirements and the statement TOE security assurance requirements are complete, coherent, and internally consistent.**

APE_SRE Protection Profile, Explicitly Stated TOE Security Requirements

Objectives

133 If, after careful consideration, none of the Part 2 or Part 3 requirements components are readily applicable to all or parts of the TOE security requirements, the PP author may state other requirements which do not reference the CC. The use of such requirements shall be justified.

134 This family presents evaluation requirements which permit the evaluator to determine that the explicitly stated requirements are clearly and unambiguously expressed. The evaluation of requirements taken from the CC in conjunction with valid explicitly stated security requirements is addressed by the APE_REQ family.

135 Explicitly stated IT security requirements for a TOE presented or cited in a PP need to be evaluated in order to demonstrate that they are clearly and unambiguously expressed.

Application notes

136 Formulation of the explicitly stated requirements in a structure comparable to those of existing CC components and elements involves choosing similar labelling, manner of expression, and level of detail.

137 Using the CC requirements as a model means that the requirements can be clearly identified, that they are self-contained, and that the application of each requirement is feasible and will yield a meaningful evaluation result based on a compliance statement of the TOE for that particular requirement.

138 “TOE security requirements” refers to “TOE security functional requirements” and/or “TOE security assurance requirements.”

APE_SRE.1 Protection Profile, Explicitly Stated TOE Security Requirements, Evaluation Requirements

Dependencies:

APE_OBJ.1 Protection Profile, Security Objectives, Evaluation Requirements

APE_REQ.1 Protection Profile, TOE Security Requirements, Evaluation Requirements

Developer action elements:

APE_SRE.1.1D **The PP developer shall provide a statement of TOE security functional requirements and a statement of TOE security assurance requirements as part of the PP.**

APE_SRE.1.2D **The PP developer shall provide the security requirements rationale.**

Content and presentation of evidence elements:

APE_SRE.1.1C **All TOE security requirements which are explicitly stated without reference to the CC shall be identified.**

APE_SRE.1.2C **The evidence shall justify why the security requirements had to be explicitly stated.**

APE_SRE.1.3C **The explicitly stated TOE security requirements shall use the CC requirements components, families and classes as a model for presentation.**

APE_SRE.1.4C **The explicitly stated TOE security requirements shall be measurable and state objective evaluation requirements such that compliance or noncompliance of a TOE can be determined and systematically demonstrated.**

APE_SRE.1.5C **The explicitly stated TOE security requirements shall be clearly and unambiguously expressed.**

APE_SRE.1.6C **The security requirements rationale shall demonstrate that the assurance requirements are applicable and appropriate to support any explicitly stated TOE security functional requirements.**

Evaluator action elements:

APE_SRE.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

APE_SRE.1.2E **The evaluator shall determine that all of the dependencies of the explicitly stated TOE security requirements have been identified.**

Class ASE

Security Target evaluation

139 The goal of an ST evaluation is to demonstrate that the ST is complete, consistent, technically sound, and hence suitable for use as the basis for the corresponding TOE evaluation.

140 Figure 3.2 shows the families within this class.

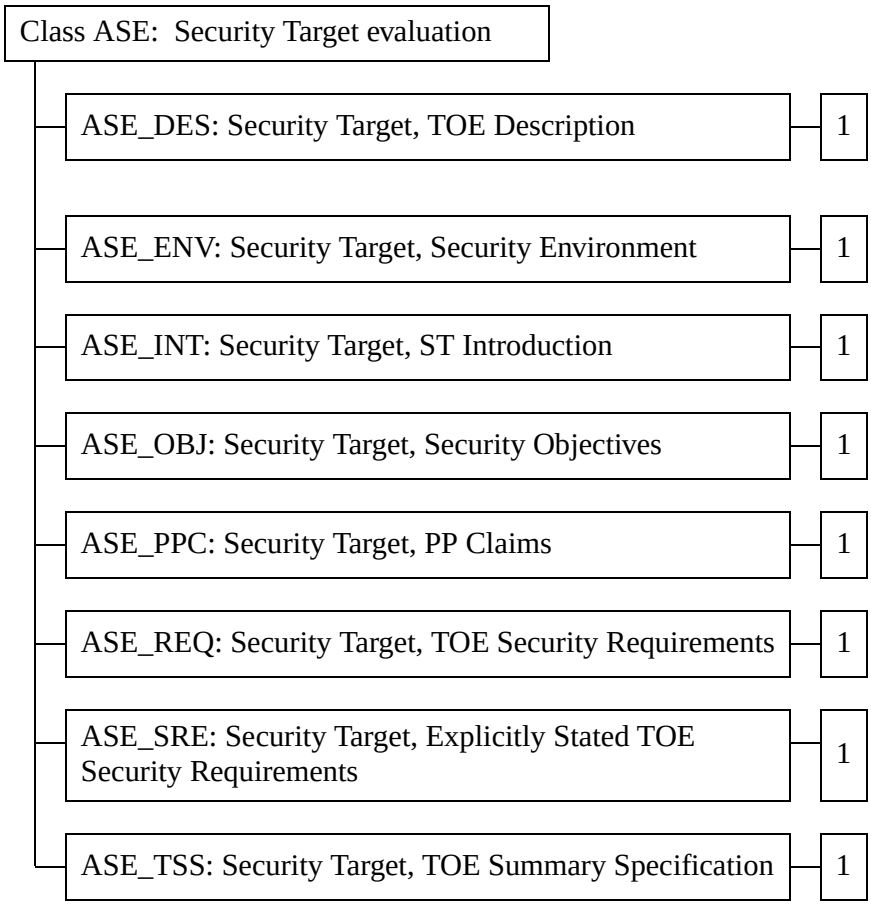

Figure 3.2 - Security Target evaluation class decomposition

ASE_DES Security Target, TOE Description

Objectives

141 The TOE description is an aid to the understanding of the TOE's security requirements. Evaluation of the TOE description is required to show that it is coherent and internally consistent and that it is consistent with all other parts of the ST.

ASE_DES.1 Security Target, TOE Description, Evaluation Requirements

Dependencies:

ASE_ENV.1 Security Target, Security Environment, Evaluation Requirements

ASE_INT.1 Security Target, ST Introduction, Evaluation Requirements

ASE_OBJ.1 Security Target, Security Objectives, Evaluation Requirements

ASE_REQ.1 Security Target, TOE Security Requirements, Evaluation Requirements

ASE_SRE.1 Security Target, Explicitly Stated TOE Security Requirements, Evaluation Requirements

Developer action elements:

ASE_DES.1.1D **The ST developer shall provide a TOE Description as part of the ST.**

Content and presentation of evidence elements:

ASE_DES.1.1C **The TOE description shall as a minimum describe the product type and the general IT features of the TOE.**

Evaluator action elements:

ASE_DES.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ASE_DES.1.2E **The evaluator shall confirm that the TOE description is coherent and internally consistent.**

ASE_DES.1.3E **The evaluator shall confirm that the TOE description is consistent with the other parts of the ST.**

ASE_ENV Security Target, Security Environment

Objectives

142 In order to determine whether the IT security requirements in the ST are sufficient, it is important that the security problem to be solved is clearly understood by all parties to the evaluation.

ASE_ENV.1 Security Target, Security Environment, Evaluation Requirements

Dependencies:

No dependencies.

Developer action elements:

ASE_ENV.1.1D **The developer shall provide a statement of TOE security environment as part of the ST.**

Content and presentation of evidence elements:

ASE_ENV.1.1C **The statement of TOE security environment shall identify and explain any assumptions about the intended usage of the TOE and the environment of use of the TOE. These shall include as a minimum assumptions regarding the physical, personnel, and connectivity aspects of that environment.**

ASE_ENV.1.2C **The statement of TOE security environment shall identify and explain any known or presumed threats to the assets against which protection will be required, either by the TOE or by its environment.**

ASE_ENV.1.3C **The statement of TOE security environment shall identify and explain any organisational security policies that the TOE must comply with.**

Evaluator action elements:

ASE_ENV.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ASE_ENV.1.2E **The evaluator shall confirm that the statement of TOE security environment is coherent and internally consistent.**

ASE_INT Security Target, ST Introduction

Objectives

143 The ST introduction contains identification and indexing material. Evaluation of the ST introduction is required to demonstrate that the ST is correctly identified and that it is consistent with all other parts of the ST.

ASE_INT.1 Security Target, ST Introduction, Evaluation Requirements

Dependencies:

ASE_DES.1 Security Target, TOE Description, Evaluation Requirements

ASE_ENV.1 Security Target, Security Environment, Evaluation Requirements

ASE_OBJ.1 Security Target, Security Objectives, Evaluation Requirements

ASE_PPC.1 Security Target, PP Claims, Evaluation Requirements

ASE_REQ.1 Security Target, TOE Security Requirements, Evaluation Requirements

ASE_SRE.1 Security Target, Explicitly Stated TOE Security Requirements, Evaluation Requirements

ASE_TSS.1 Security Target, TOE Summary Specification, Evaluation Requirements

Developer action elements:

ASE_INT.1.1D **The developer shall provide an ST introduction as part of the ST.**

Content and presentation of evidence elements:

ASE_INT.1.1C **The ST introduction shall contain an ST identification which provides the labelling and descriptive information necessary to control and identify the ST and the TOE to which it refers.**

ASE_INT.1.2C **The ST introduction shall contain an ST overview which summarises the ST in narrative form.**

ASE_INT.1.3C **The ST introduction shall contain a CC conformance claim which states any evaluatable claim of CC conformance for the TOE.**

Evaluator action elements:

ASE_INT.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ASE_INT.1.2E **The evaluator shall confirm that the ST introduction is coherent and internally consistent.**

ASE_INT.1.3E **The evaluator shall confirm that the ST introduction is consistent with the other parts of the ST.**

ASE_OBJ Security Target, Security Objectives

Objectives

144 The security objectives are a concise statement of the intended response to the security problem. Evaluation of the security objectives is required to demonstrate that the stated objectives adequately address the security problem. The security objectives are categorised as security objectives for the TOE and security objectives for the environment. The security objectives for both the TOE and the environment must be shown to be traced back to the identified threats to be countered and/or policies and assumptions to be met by each.

ASE_OBJ.1 Security Target, Security Objectives, Evaluation Requirements

Dependencies:

ASE_ENV.1 Security Target, Security Environment, Evaluation Requirements

Developer action elements:

ASE_OBJ.1.1D **The developer shall provide a statement of security objectives as part of the ST.**

ASE_OBJ.1.2D **The developer shall provide the security objectives rationale.**

Content and presentation of evidence elements:

ASE_OBJ.1.1C **The statement of security objectives shall define the security objectives for the TOE and its environment.**

ASE_OBJ.1.2C **The security objectives for the TOE shall be clearly stated and traced back to the identified threats to be countered and/or organisational security policies to be met by the TOE.**

ASE_OBJ.1.3C **The security objectives for the environment shall be clearly stated and traced back to the identified threats to be countered and/or organisational security policies or assumptions to be met in the TOE's environment.**

ASE_OBJ.1.4C **The security objectives rationale shall demonstrate that the stated security objectives are suitable to counter the identified threats to security.**

ASE_OBJ.1.5C **The security objectives rationale shall demonstrate that the stated security objectives are suitable to cover all of the identified organisational security policies and assumptions.**

Evaluator action elements:

ASE_OBJ.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ASE_OBJ.1.2E **The evaluator shall confirm that the statement of security objectives is complete, coherent, and internally consistent.**

ASE_PPC Security Target, PP Claims

Objectives

145 The goal of the evaluation of the Security Target PP claims is to determine whether the ST is a correct instantiation of the PP.

Application notes

146 The family applies only in the case of a PP claim. In all other cases no developer action and no evaluator action is necessary.

147 Although additional evaluation activity is necessary when a PP claim is made, the ST evaluation effort is generally smaller than in cases where no PP is used because it is possible to reuse the PP evaluation results for the ST evaluation.

ASE_PPC.1 Security Target, PP Claims, Evaluation Requirements

Dependencies:

ASE_OBJ.1 Security Target, Security Objectives, Evaluation Requirements

ASE_REQ.1 Security Target, TOE Security Requirements, Evaluation Requirements

ASE_SRE.1 Security Target, Explicitly Stated TOE Security Requirements, Evaluation Requirements

Developer action elements:

ASE_PPC.1.1D **The developer shall provide any PP claims as part of the ST.**

ASE_PPC.1.2D **The developer shall provide the PP claims rationale for each provided PP claim.**

Content and presentation of evidence elements:

ASE_PPC.1.1C **Each PP claim shall identify the PP for which compliance is being claimed, including qualifications needed for that claim.**

ASE_PPC.1.2C **Each PP claim shall identify the TOE security requirements statements which satisfy the permitted operations of the PP or otherwise further qualify the PP requirements.**

ASE_PPC.1.3C **Each PP claim shall identify security objectives and IT security requirements statements contained in the ST which are additional to security objectives and the IT security requirements contained in the PP.**

Evaluator action elements:

ASE_PPC.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ASE_PPC.1.2E **The evaluator shall confirm that the PP claims are a correct instantiation of the PP.**

ASE_REQ Security Target, TOE Security Requirements

Objectives

148 The IT security requirements chosen for a TOE and presented or cited in an ST need to be evaluated in order to confirm that they are internally consistent and lead to the development of a TOE which will meet its security objectives.

149 This family presents evaluation requirements which permit the evaluator to determine that an ST is suitable for use as a statement of requirements for the corresponding TOE. The additional criteria necessary for the evaluation of explicitly stated requirements is covered in the ASE_SRE family.

Application notes

150 "TOE security requirements" refers to "TOE security functional requirements" and/or "TOE security assurance requirements."

ASE_REQ.1 Security Target, TOE Security Requirements, Evaluation Requirements

Dependencies:

ASE_OBJ.1 Security Target, Security Objectives, Evaluation Requirements

Developer action elements:

ASE_REQ.1.1D **The developer shall provide a statement of TOE security functional requirements and a statement of TOE security assurance requirements as part of the ST.**

ASE_REQ.1.2D **The developer shall provide the security requirements rationale.**

Content and presentation of evidence elements:

ASE_REQ.1.1C **The statement of TOE security functional requirements shall identify the TOE security functional requirements drawn from CC Part 2 functional requirements components.**

ASE_REQ.1.2C **The statement of TOE security assurance requirements shall identify the TOE security assurance requirements drawn from CC Part 3 assurance requirements components.**

ASE_REQ.1.3C **The statement of TOE security assurance requirements should include a CC Evaluation Assurance Level (EAL) as defined in CC Part 3.**

ASE_REQ.1.4C **The evidence shall justify that the statement of TOE security assurance requirements is appropriate.**

ASE_REQ.1.5C **The ST shall, if appropriate, identify any security requirements for the IT environment.**

ASE_REQ.1.6C **Operations on TOE security requirements included in the ST shall be identified and performed.**

ASE_REQ.1.7C **Dependencies among the TOE security requirements included in the ST should be satisfied.**

ASE_REQ.1.8C **The evidence shall justify why any non-satisfaction of dependencies is appropriate.**

ASE_REQ.1.9C **The ST shall include a statement of the minimum strength of function level for the TOE security functional requirements, either SOF-basic, SOF-medium or SOF-high, as appropriate.**

ASE_REQ.1.10C **The ST shall identify any specific TOE security functional requirements for which an explicit strength of function is appropriate, together with the specific metric.**

ASE_REQ.1.11C **The security requirements rationale shall demonstrate that the minimum strength of function level for the ST together with any explicit strength of function claim is consistent with the security objectives for the TOE.**

ASE_REQ.1.12C **The security requirements rationale shall demonstrate that all of the TOE security requirements are suitable to meet the security objectives for the TOE.**

ASE_REQ.1.13C **The security requirements rationale shall demonstrate that the set of TOE security requirements together forms a mutually supportive and internally consistent whole.**

Evaluator action elements:

ASE_REQ.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ASE_REQ.1.2E **The evaluator shall confirm that the statement TOE security functional requirements and the statement TOE security assurance requirements are complete, coherent, and internally consistent.**

ASE_SRE Security Target, Explicitly Stated TOE Security Requirements

Objectives

151 If, after careful consideration, none of the Part 2 or Part 3 requirements components are readily applicable to all or parts of the TOE security requirements, the ST author may state other requirements which do not reference the CC. The use of such requirements shall be justified.

152 This family presents evaluation requirements which permit the evaluator to determine that the explicitly stated requirements are clearly and unambiguously expressed. The evaluation of requirements taken from the CC in conjunction with valid explicitly stated security requirements is addressed by the ASE_REQ family.

153 Explicitly stated IT security requirements for a TOE presented or cited in an ST need to be evaluated in order to demonstrate that they are clearly and unambiguously expressed.

Application notes

154 Formulation of the explicitly stated requirements in a structure comparable to those of existing CC components and elements involves choosing similar labelling, manner of expression, and level of detail.

155 Using the CC requirements as a model means that the requirements can be clearly identified, that they are self-contained, and that the application of each requirement is feasible and will yield a meaningful evaluation result based on a compliance statement of the TOE for that particular requirement.

156 “TOE security requirements” refers to “TOE security functional requirements” and/or “TOE security assurance requirements.”

ASE_SRE.1 Security Target, Explicitly Stated TOE Security Requirements, Evaluation Requirements

Dependencies:

APE_OBJ.1 Protection Profile, Security Objectives, Evaluation Requirements

APE_REQ.1 Protection Profile, TOE Security Requirements, Evaluation Requirements

Developer action elements:

ASE_SRE.1.1D **The developer shall provide a statement of TOE security functional requirements and a statement of TOE security assurance requirements as part of the ST.**

ASE_SRE.1.2D **The developer shall provide the security requirements rationale.**

Content and presentation of evidence elements:

ASE_SRE.1.1C **All TOE security requirements which are explicitly stated without reference to the CC shall be identified.**

ASE_SRE.1.2C **The evidence shall justify why the security requirements had to be explicitly stated.**

ASE_SRE.1.3C **The explicitly stated TOE security requirements shall use the CC requirements components, families and classes as a model for presentation.**

ASE_SRE.1.4C **The explicitly stated TOE security requirements shall be measurable and state objective evaluation requirements such that compliance or noncompliance of a TOE can be determined and systematically demonstrated.**

ASE_SRE.1.5C **The explicitly stated TOE security requirements shall be clearly and unambiguously expressed.**

ASE_SRE.1.6C **The security requirements rationale shall demonstrate that the assurance requirements are applicable and appropriate to support any explicitly stated TOE security functional requirements.**

Evaluator action elements:

ASE_SRE.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ASE_SRE.1.2E **The evaluator shall determine that all of the dependencies of the explicitly stated TOE security requirements have been identified.**

ASE_TSS Security Target, TOE Summary Specification

Objectives

157 The TOE summary specification provides a high-level definition of the security functions claimed to meet the functional requirements and of the assurance measures taken to meet the assurance requirements.

Application notes

158 The relationship between the IT security functions and the TOE security functional requirements can be a “many to many” relationship. Nevertheless, every security function shall contribute to the satisfaction of at least one security requirement in order be able to clearly define the TSF. Security functions which do not fulfil this requirement should normally not be necessary. Note, however, that the requirement that a security function contributes to the satisfaction of at least one security requirement is worded in a quite general manner, so that all the security functions found to be useful for the TOE should be justifiable.

159 The statement of assurance measures is of specific relevance in all those cases where assurance requirements not taken from the CC are included in the ST. If the TOE security assurance requirements in the ST are exclusively based on CC evaluation assurance levels or other CC assurance components, then the assurance measures could be presented in the form of a reference to the documents which show that the assurance requirements are met.

ASE_TSS.1 Security Target, TOE Summary Specification, Evaluation Requirements

Dependencies:

ASE_REQ.1 Security Target, TOE Security Requirements, Evaluation Requirements

ASE_SRE.1 Security Target, Explicitly Stated TOE Security Requirements, Evaluation Requirements

Developer action elements:

ASE_TSS.1.1D **The developer shall provide a TOE summary specification as part of the ST.**

ASE_TSS.1.2D **The developer shall provide the TOE summary specification rationale.**

Content and presentation of evidence elements:

ASE_TSS.1.1C **The TOE summary specification shall describe the IT security functions and the assurance measures of the TOE.**

ASE_TSS.1.2C **The TOE summary specification shall trace the IT security functions to the TOE security functional requirements such that it can be seen which IT security functions satisfy which TOE security functional requirements and**

that every IT security function contributes to the satisfaction of at least one TOE security functional requirement.

ASE_TSS.1.3C **The IT security functions shall be defined in an informal style to a level of detail necessary for understanding their intent.**

ASE_TSS.1.4C **All references to security mechanisms included in the ST shall be traced to the relevant security functions so that it can be seen which required mechanisms are used in the implementation of each function.**

ASE_TSS.1.5C **The TOE summary specification rationale shall demonstrate that the IT security functions are suitable to meet TOE security functional requirements.**

ASE_TSS.1.6C **The TOE summary specification rationale shall demonstrate that the combination of the specified IT security functions work together so as to satisfy the TOE security functional requirements.**

ASE_TSS.1.7C **The TOE summary specification shall trace the assurance measures to the assurance requirements such that it can be seen which measures satisfy which requirements.**

ASE_TSS.1.8C **The TOE summary specification rationale shall demonstrate that the assurance measures meet all assurance requirements of the TOE.**

ASE_TSS.1.9C **The TOE summary specification shall identify all IT security functions which are realised by a probabilistic or permutational mechanism, as appropriate.**

ASE_TSS.1.10C **The TOE summary specification shall, for each IT security functions for which it is appropriate, state the strength of function claim either as a specific metric, or as SOF-basic, SOF-medium or SOF-high.**

Evaluator action elements:

ASE_TSS.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ASE_TSS.1.2E **The evaluator shall confirm that the TOE summary specification is complete, coherent, and internally consistent.**

D R A F T

Chapter 4

Assurance levels

160 The Evaluation Assurance Levels (EALs) provide an increasing scale which balances the level of assurance obtained with the cost and feasibility of acquiring that degree of assurance. The CC approach divides the concepts of assurance in a TOE at the end of the evaluation and maintenance of that assurance during the operational use of the TOE.

161 It is important to note that not all families from Part 3 are included in the EALs listed here. This is not to say that these components do not provide meaningful and desirable assurances. Instead, it is expected that these components will be used for augmentation of an EAL in those PPs and STs for which they provide utility.

D R A F T

4.1 Evaluation assurance level (EAL) overview

Assurance Class	Assurance Family	Assurance Components by Evaluation Assurance Level						
		EAL1	EAL2	EAL3	EAL4	EAL5	EAL6	EAL7
Configuration management	ACM_AUT				**1**	1	**2**	2

Table 4.1 -Evaluation Assurance Level Summary

162 Table 4.1 represents a summary of the EALs. The columns represent a hierarchically ordered set of EALs, while the rows represent assurance families. Each point in the resulting matrix identifies a specific assurance component where applicable.

163 As outlined in the next section, seven hierarchically ordered evaluation assurance levels are defined in this CC for the rating of a TOE's assurance. They are hierarchically ordered inasmuch as each EAL represents more assurance than all

lower EALs. The increase in assurance from EAL to EAL is accomplished by *substituting* a hierarchically higher assurance component from the same assurance family (i.e. increasing rigour, scope, and/or depth) and from the *addition* of assurance components from other assurance families (i.e. adding new requirements).

164 These EALs consist of an appropriate combination of assurance components as described in Chapter 2 of this Part. More precisely, each EAL includes no more than one component of each assurance family and all assurance dependencies of every component are addressed.

165 While the EALs are defined in the CC, it is possible to represent other combinations of assurance. Specifically, the notion of "augmentation" allows the addition of assurance components (from assurance families not already included in the EAL) or the substitution of assurance components (with another hierarchically higher assurance component in the same assurance family) to an EAL. Of the assurance constructs defined in the CC, only EALs may be augmented. The notion of an "EAL minus a constituent assurance component" is not recognised by the CC as a valid claim. Augmentation carries with it the obligation on the part of the claimant to justify the utility and added value of the added assurance component to the EAL. An EAL may also be extended with explicitly stated assurance requirements.

4.2 Evaluation assurance level details

166 The following sections provide definitions of the EALs, highlighting differences between the specific requirements and the prose characterisations of those requirements using bold type.

D R A F T

4.2.1 Evaluation assurance level 1 (EAL1) - functionally tested

Objectives

167 EAL1 is intended to allow the detection of obvious errors for a minimum outlay, but is unlikely to result in the detection of other than very obvious security weaknesses.

168 EAL1 is applicable in circumstances where those responsible for user data may wish or be obliged to seek independent assurances in the IT security, but the risks to security are not viewed as serious. Under these circumstances, an EAL1 rating would be of value to support the contention that due care had been exercised with respect to personal or similar information.

169 It is intended that the documentation requirements for an EAL1 evaluation could be met without assistance from the developer of the TOE.

Assurance components

170 **EAL1 (see Table 4.2) provides a basic level of assurance by an analysis of the security functions using a functional and interface specification of the TOE, to understand the security behaviour.**

171 **The analysis is supported by independent testing of each of the security functions.**

172 This EAL, nonetheless, represents a meaningful increase over an unevaluated IT product or system (TOE).

Assurance class	Assurance components
Configuration management	**ACM_CAP.1 Version numbers**
Development	**ADV_FSP.1 Informal functional specification**
	ADV_RCR.1 Informal correspondence demonstration
Guidance documents	**AGD_ADM.1 Administrator guidance**
	AGD_USR.1 User guidance
Tests	**ATE_IND.1 Independent testing - conformance**

Table 4.2 -EAL1

D R A F T

4.2.2 Evaluation assurance level 2 (EAL2) - structurally tested

Objectives

173 EAL2 is the highest assurance level that can be used without imposing other than minimal additional tasks upon the developer. If the developer applies reasonable standards of care to the development, EAL2 may be feasible without developer involvement other than support for security functional testing.

174 EAL2 is therefore applicable in those circumstances where developers or users require a low to moderate level of independently assured security in the absence of ready availability of the complete development record. Such a situation may arise when securing legacy systems or where access to the developer may be limited.

Assurance components

175 **EAL2** (see Table **4.3**) provides assurance by an analysis of the security functions using a functional and interface specification **and the high-level design of the subsystems** of the TOE, to understand the security behaviour**.**

176 The analysis is supported by independent testing of each of the security functions**, evidence of developer "black box" testing, selective independent confirmation of the developer test results, and evidence of a developer search for obvious vulnerabilities (e.g. those in the public domain).**

177 **EAL2 also provides assurance through a configuration list for the TOE, and evidence of secure delivery procedures**.

178 This EAL represents a meaningful increase in assurance from EAL1 by requiring developer testing, a vulnerability analysis, and independent testing based upon more detailed TOE specifications.

D R A F T

Assurance class	Assurance components
Configuration management	**ACM_CAP.2 Configuration items**

Vulnerability assessment	**AVA_SOF.1 Strength of TOE security function evaluation**
	AVA_VLA.1 Developer vulnerability analysis

Table 4.3 -EAL2

4.2.3 Evaluation assurance level 3 (EAL3) - methodically tested and checked

Objectives

179 EAL3 permits a conscientious developer to gain maximum assurance from positive security engineering at the design stage without substantial alteration of existing sound development practices.

180 EAL3 is therefore applicable in those circumstances where developers or users require a moderate level of independently assured security and require a thorough investigation of the TOE and its development without substantial re-engineering.

Assurance components

181 **EAL3** (see Table **4.4**) provides assurance by an analysis of the security functions using a functional and interface specification and the high-level design of the subsystems of the TOE, to understand the security behaviour**.**

182 The analysis is supported by independent testing of the security functions, evidence of developer "**grey** box" testing, selective independent confirmation of the developer test results, evidence of a developer search for obvious vulnerabilities (e.g. those in the public domain).

183 **EAL3** also provides assurance through **the use of development environment controls, TOE configuration management,** and evidence of secure delivery procedures**.**

184 This EAL represents a meaningful increase in assurance from EAL2 by requiring more complete testing coverage of the security functions and mechanisms and/or procedures that provide some confidence that the TOE will not be tampered with during development.

D R A F T

Assurance class	Assurance components

Table 4.4 -EAL3

4.2.4 Evaluation assurance level 4 (EAL4) - methodically designed, tested, and reviewed

Objectives

185 EAL4 permits a developer to gain maximum assurance from positive security engineering based on good commercial development practices which, though rigorous, do not require substantial specialist knowledge, skills, and other resources. EAL4 is the highest level which it is likely to be economically feasible to retrofit to an existing product line.

186 EAL4 is therefore applicable in those circumstances where developers or users require a moderate to high level of independently assured security in conventional commodity TOEs and are prepared to incur additional security specific engineering costs.

Assurance components

187 **EAL4** (see Table **4.5**) provides assurance by an analysis of the security functions using a functional and **complete** interface specification**,** the high-level design of the subsystems, **the low-level design of the modules of the TOE, and a subset of the implementation**, to understand the security behaviour**. Assurance is additionally gained through an informal model.**

188 The analysis is supported by independent testing of the security functions, evidence of developer “grey box” testing, selective independent confirmation of the developer test results, evidence of a developer search for obvious vulnerabilities (e.g. those in the public domain), **and an independent search for obvious vulnerabilities**.

189 **EAL4** also provides assurance through the use of development environment controls and **additional** TOE configuration management **including automation,** and evidence of secure delivery procedures.

190 This EAL represents a meaningful increase in assurance from EAL3 by requiring more design description, a subset of the implementation, and improved mechanisms and/or procedures that provide confidence that the TOE will not be tampered with during development or delivery.

	AVA_VLA.2 Independent vulnerability analysis

Table 4.5 -EAL4

4.2.5 Evaluation assurance level 5 (EAL5) - semiformally designed and tested

Objectives

191 EAL5 permits a developer to gain maximum assurance from security engineering based upon rigorous commercial development practices supported by moderate application of specialist security engineering techniques. Such a TOE will probably be designed and developed with the intent of achieving EAL5 assurance. It is likely that the additional costs attributable to the EAL5 requirements relative to rigorous development without the application of specialised techniques will not be large.

192 EAL5 is therefore applicable in those circumstances where developers or users require a high level of independently assured security in a planned development and require a rigorous development approach without incurring unreasonable costs attributable to specialist security engineering techniques.

Assurance components

193 **EAL5** (see Table **4.6**) provides assurance by an analysis of the security functions using a functional and complete interface specification**,** the high-level design of the subsystems, the low-level design of the modules of the TOE, and **all** of the implementation, to understand the security behaviour**.** Assurance is additionally gained through **a formal** model **and a semiformal presentation of the functional specification and high-level design and a semiformal demonstration of correspondence between them.**

194 The analysis is supported by independent testing of the security functions, evidence of developer "grey box" testing, selective independent confirmation of the developer test results, evidence of a developer search for obvious vulnerabilities (e.g. those in the public domain), and an independent search for **vulnerabilities ensuring relative resistance to penetration attack**. **The analysis also includes validation of the developer's covert channel analysis. A modular TOE design is also required.**

195 **EAL5** also provides assurance through the use of a development environment controls, and **comprehensive** TOE configuration management including automation, and evidence of secure delivery procedures.

196 This EAL represents a meaningful increase in assurance from EAL4 by requiring semiformal design descriptions, the entire implementation, a more structured (and hence analysable) architecture, covert channel analysis, and improved mechanisms and/or procedures that provide confidence that the TOE will not be tampered with during development.

	AVA_VLA.3 Relatively resistant

Table 4.6 -EAL5

4.2.6 Evaluation assurance level 6 (EAL6) - semiformally verified design and tested

Objectives

197 EAL6 permits developers to gain high assurance from application of security engineering techniques to a rigorous development environment in order to produce a premium TOE for protecting high value assets against significant risks.

198 EAL6 is therefore applicable to the development of security TOEs for application in high risk situations where the value of the protected assets justifies the additional costs.

Assurance components

199 **EAL6** (see Table **4.7**) provides assurance by an analysis of the security functions using a functional and complete interface specification**,** the high-level design of the subsystems, the low-level design of the modules of the TOE, and **a structured presentation** of the implementation, to understand the security behaviour**.** Assurance is additionally gained through a formal model, a semiformal presentation of the functional specification, high-level design**, and low-level design** and a semiformal demonstration of correspondence between them.

200 The analysis is supported by independent testing of the security functions, evidence of developer "grey box" testing, selective independent confirmation of the developer test results, evidence of a developer search for obvious vulnerabilities (e.g. those in the public domain), and an independent search for vulnerabilities assuring **high** resistance to penetration attack. The analysis also includes validation of the developer's **systematic** covert channel analysis. A modular **and layered** TOE design is also required.

201 **EAL6** also provides assurance through the use of a **structured development process,** development environment controls, and comprehensive TOE configuration management including **complete** automation, and evidence of secure delivery procedures.

202 This EAL represents a meaningful increase in assurance from EAL5 by requiring more comprehensive analysis, a structured representation of the implementation, more architectural structure (e.g. layering), more comprehensive independent vulnerability analysis, systematic covert channel identification, and improved configuration management and development environment controls.

D R A F T

Assurance class	Assurance components
Configuration management	**ACM_AUT.2 Complete CM automation**

	AVA_SOF.1 Strength of TOE security function evaluation
	AVA_VLA.4 Highly resistant

Table 4.7 -EAL6

4.2.7 Evaluation assurance level 7 (EAL7) - formally verified design and tested

Objectives

203 EAL7 is applicable to the development of security TOEs for application in extremely high risk situations and/or where the high value of the assets justifies the higher costs. Practical application of EAL7 is currently limited to TOEs with tightly focused security functionality which is amenable to extensive formal analysis.

Assurance components

204 **EAL7** (see Table **4.8**) provides assurance by an analysis of the security functions using a functional and complete interface specification, the high-level design of the subsystems, the low-level design of the modules of the TOE, and a structured presentation of the implementation, to understand the security behaviour. Assurance is additionally gained through a formal model**, a formal presentation of the functional specification and high-level design**, a semiformal presentation of the low-level design, and **formal and** semiformal demonstration of correspondence between them**, as appropriate**.

205 The analysis is supported by independent testing of the security functions, evidence of developer "**white** box" testing, **complete** independent confirmation of the developer test results, evidence of a developer search for obvious vulnerabilities (e.g. those in the public domain), and an independent search for vulnerabilities ensuring high resistance to penetration attack. The analysis also includes validation of the developer's systematic covert channel analysis. A modular, layered **and simple** TOE design is also required.

206 The analysis also includes a systematic search for covert channels, when applicable, and is supported by requiring a modular, layered, **and simple** TOE design.

207 **EAL7** also provides assurance through the use of a structured development process, development environment controls, and comprehensive TOE configuration management including complete automation, and evidence of secure delivery procedures.

208 This EAL represents a meaningful increase in assurance from EAL6 by requiring more comprehensive analysis using formal representations and formal correspondence, and comprehensive testing**.**

D R A F T

Chapter 5

Assurance classes, families, and components

209 This chapter provides the detailed requirements, presented in alphabetical order, of each of the assurance components, grouped by class and family.

D R A F T

Class ACM

Configuration management

210 Configuration management (CM) is one method or means for establishing that the functional requirements and specifications are realised in the implementation of the TOE. CM meets these objectives by requiring discipline and control in the processes of refinement and modification of the TOE. CM systems are put in place to ensure the integrity of the portions of the TOE that they control, by providing a method of tracking any changes, and by ensuring that only authorised users are capable of changing them.

211 Figure 5.1 shows the families within this class, and the hierarchy of components within the families.

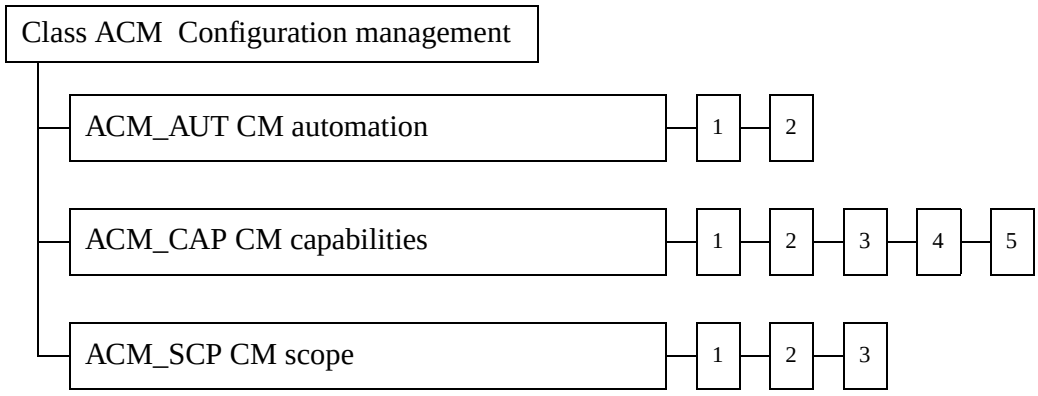

Figure 5.1 -Configuration management class decomposition

D R A F T

ACM_AUT CM automation

Objectives

212 The objective of introducing automated CM tools is to increase the effectiveness of the CM system. While both automated and manual CM systems can be bypassed, ignored, or insufficient to prevent unauthorised modification, automated systems are less susceptible to human error or negligence.

Component levelling

213 The components in this family are levelled on the basis of the set of configuration items which are controlled through automated means.

Application notes

214 Both ACM_AUT.1.3C and ACM_AUT.1.4C introduce requirements that are related to the implementation representation of the TOE. The implementation representation of the TOE consists of all hardware, software, and firmware that comprise the physical TOE. In the case of a software-only TOE, the implementation representation may consist solely of source and object code.

215 ACM_AUT.1.4C introduces a requirement that the CM system provide an automated means to support the generation of the TSF from its implementation representation. Requiring support for the generation of the TSF does not necessarily require the capability to generate the TSF; rather, it is sufficient that the CM system possess the means to verify the correct generation of the TSF.

216 ACM_AUT.2.5C introduces a requirement that the CM system provide an automated means to ascertain the changes between the TOE and its preceding version. If no previous version of the TOE exists, the developer still needs to provide an automated means to ascertain the changes between the TOE and a future version of the TOE.

ACM_AUT.1 Partial CM automation

Objectives

217 In development environments where the implementation representation is complex or is being developed by multiple developers, it is difficult to control changes without the support of automated tools. In particular, these automated tools need to be able to support the numerous changes that occur during development and ensure that those changes are performed by authorised developers before their application. It is the objective of this component to ensure that the implementation representation is controlled through automated means.

Dependencies:

ACM_CAP.3 Authorisation controls

D R A F T

Developer action elements:

ACM_AUT.1.1D **The developer shall use a CM system.**

ACM_AUT.1.2D **The developer shall provide a CM plan.**

Content and presentation of evidence elements:

ACM_AUT.1.1C **The CM plan shall describe the automated tools used in the CM system.**

ACM_AUT.1.2C **The CM plan shall describe how the automated tools are used in the CM system.**

ACM_AUT.1.3C **The CM system shall provide an automated means by which only authorised changes are made to the TOE implementation representation.**

ACM_AUT.1.4C **The CM system shall provide an automated means to support the generation of the TSF from its implementation representation.**

Evaluator action elements:

ACM_AUT.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ACM_AUT.2 Complete CM automation

Objectives

218 In development environments where the configuration items are complex or are being developed by multiple developers, it is difficult to control changes without the support of automated tools. In particular, these automated tools need to be able to support the numerous changes that occur during development and ensure that those changes are performed by authorised developers before their application. It is the objective of this component to ensure that all configuration items are controlled through automated means.

Dependencies:

ACM_CAP.3 Authorisation controls

Developer action elements:

ACM_AUT.2.1D The developer shall use a CM system.

ACM_AUT.2.2D The developer shall provide a CM plan.

Content and presentation of evidence elements:

ACM_AUT.2.1C The CM plan shall describe the automated tools used in the CM system.

D R A F T

ACM_AUT.2.2C The CM plan shall describe how the automated tools are used in the CM system.

ACM_AUT.2.3C The CM system shall provide an automated means by which only authorised changes are made to the TOE implementation representation**, and to all other configuration items.**

ACM_AUT.2.4C The CM system shall provide an automated means to support the generation of the TSF from its implementation representation.

ACM_AUT.2.5C **The CM system shall provide an automated means to ascertain the changes between the TOE and its preceding version.**

ACM_AUT.2.6C **The CM system shall provide an automated means to identify all other configuration items that are affected by the modification of a given configuration item.**

Evaluator action elements:

ACM_AUT.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

D R A F T

ACM_CAP CM capabilities

Objectives

219 The capabilities of the CM system address the likelihood that accidental or unauthorised modifications of the configuration items will occur. The CM system should ensure the integrity of the TOE from the early design stages through all subsequent maintenance efforts.

220 The objectives of this family include the following:

a) ensuring that the TOE is correct and complete before it is sent to the consumer;

b) ensuring that no configuration items are missed during evaluation;

c) preventing unauthorised modification, addition, or deletion of TOE configuration items.

Component levelling

221 The components in this family are levelled on the basis of what the CM system's capabilities are, the scope of the CM documentation provided by the developer, and whether the developer provides justification that the CM system meets its security requirements.

Application notes

222 ACM_CAP.2.2C introduces a requirement that a configuration list be provided. The configuration list contains all configuration items which are maintained by the CM system.

223 ACM_CAP.2.5C introduces a requirement that the CM system uniquely identify all configuration items. This includes a requirement that modifications to configuration items also result in a new, unique identifier being assigned.

224 ACM_CAP.3.7C introduces the requirement that the evidence shall demonstrate that the CM system operates in accordance with the CM plan. Examples of such evidence might be documentation such as screen snapshots or audit trail output from the CM system, or a detailed demonstration of the CM system by the developer. The evaluator is responsible for determining that this evidence is sufficient to show that the CM system operates in accordance with the CM system.

225 ACM_CAP.3.8C introduces the requirement that evidence be provided to show that all configuration items are being maintained under the CM system. Since a configuration item refers to an item which is on the configuration list, this requirement states that all items on the configuration list are maintained under the CM system.

226 ACM_CAP.4.10C introduces the requirement that the CM system support the generation of the TOE. Requiring support for generation of the TOE does not necessarily require the capability to generate the TOE; rather, it is sufficient that the CM system possess the means to verify the correct generation of the TOE.

ACM_CAP.1 Version numbers

Objectives

227 A unique reference is required to ensure that there is no ambiguity in terms of which instance of the TOE is being evaluated.

Dependencies:

No dependencies.

Developer action elements:

ACM_CAP.1.1D **The developer shall use a CM system.**

Content and presentation of evidence elements:

ACM_CAP.1.1C **The CM system shall provide a unique reference for the TOE.**

Evaluator action elements:

ACM_CAP.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ACM_CAP.2 Configuration items

Objectives

228 A unique reference is required to ensure that there is no ambiguity in terms of which instance of the TOE is being evaluated.

229 Clear identification of the TOE is required to determine those items under evaluation that are subject to the criteria requirements.

Dependencies:

No dependencies.

Developer action elements:

ACM_CAP.2.1D The developer shall use a CM system.

ACM_CAP.2.2D **The developer shall provide CM documentation.**

Content and presentation of evidence elements:

ACM_CAP.2.1C The CM system shall provide a unique reference for the TOE.

ACM_CAP.2.2C **The CM documentation shall include a configuration list.**

ACM_CAP.2.3C **The configuration list shall describe the configuration items that comprise the TOE.**

ACM_CAP.2.4C **The CM documentation shall describe the method used to uniquely identify the configuration items.**

ACM_CAP.2.5C **The CM system shall uniquely identify all configuration items.**

Evaluator action elements:

ACM_CAP.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ACM_CAP.3 Authorisation controls

Objectives

230 A unique reference is required to ensure that there is no ambiguity in terms of which instance of the TOE is being evaluated.

231 Clear identification of the TOE is required to determine those items under evaluation that are subject to the criteria requirements.

232 Assurance of TOE integrity may be gained by controlling the ability to modify the configuration items, and by ensuring proper functionality and use of the CM system.

Dependencies:

ACM_SCP.1 TOE CM coverage

ALC_DVS.1 Identification of security measures

Developer action elements:

ACM_CAP.3.1D The developer shall use a CM system.

ACM_CAP.3.2D The developer shall provide CM documentation.

Content and presentation of evidence elements:

ACM_CAP.3.1C The CM system shall provide a unique reference for the TOE.

ACM_CAP.3.2C The CM documentation shall include a configuration list **and a CM plan**.

ACM_CAP.3.3C The configuration list shall describe the configuration items that comprise the TOE.

ACM_CAP.3.4C The CM documentation shall describe the method used to uniquely identify the configuration items.

ACM_CAP.3.5C The CM system shall uniquely identify all configuration items.

ACM_CAP.3.6C **The CM plan shall describe how the CM system is used.**

ACM_CAP.3.7C **The evidence shall demonstrate that the CM system is operating in accordance with the CM plan.**

ACM_CAP.3.8C **The CM documentation shall provide evidence that all configuration items have been and are being effectively maintained under the CM system.**

ACM_CAP.3.9C **The CM system shall provide measures such that only authorised changes are made to the configuration items.**

Evaluator action elements:

ACM_CAP.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ACM_CAP.4 Generation support and acceptance procedures

Objectives

233 A unique reference is required to ensure that there is no ambiguity in terms of which instance of the TOE is being evaluated.

234 Clear identification of the TOE is required to determine those items under evaluation that are subject to the criteria requirements.

235 Assurance of TOE integrity may be gained by controlling the ability to modify the configuration items, and by ensuring proper functionality and use of the CM system.

236 The purpose of acceptance procedures is to confirm that any creation or modification of configuration items is authorised.

Dependencies:

ACM_SCP.1 TOE CM coverage

ALC_DVS.1 Identification of security measures

Developer action elements:

ACM_CAP.4.1D The developer shall use a CM system.

ACM_CAP.4.2D The developer shall provide CM documentation.

Content and presentation of evidence elements:

ACM_CAP.4.1C The CM system shall provide a unique reference for the TOE.

ACM_CAP.4.2C The CM documentation shall include a configuration list**,** a CM plan**, and an acceptance plan.**

ACM_CAP.4.3C The configuration list shall describe the configuration items that comprise the TOE.

ACM_CAP.4.4C The CM documentation shall describe the method used to uniquely identify the configuration items.

ACM_CAP.4.5C The CM system shall uniquely identify all configuration items.

ACM_CAP.4.6C The CM plan shall describe how the CM system is used.

ACM_CAP.4.7C The evidence shall demonstrate that the CM system is operating in accordance with the CM plan.

ACM_CAP.4.8C The CM documentation shall provide evidence that all configuration items have been and are being effectively maintained under the CM system.

ACM_CAP.4.9C The CM system shall provide measures such that only authorised changes are made to the configuration items.

ACM_CAP.4.10C **The CM system shall support the generation of the TOE.**

ACM_CAP.4.11C **The acceptance plan shall describe the procedures used to accept modified or newly created configuration items as part of the TOE.**

Evaluator action elements:

ACM_CAP.4.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ACM_CAP.5 Advanced support

Objectives

237 A unique reference is required to ensure that there is no ambiguity in terms of which instance of the TOE is being evaluated.

238 Clear identification of the TOE is required to determine those items under evaluation that are subject to the criteria requirements.

239 Assurance of TOE integrity may be gained by controlling the ability to modify the configuration items, and by ensuring proper functionality and use of the CM system.

D R A F T

240 The purpose of acceptance procedures is to confirm that any creation or modification of configuration items is authorised.

241 Integration procedures ensure that the introduction of modifications into the TSF is performed in a controlled and complete manner.

242 Requiring that the CM system be able to identify the master copy of the material used to generate the TOE helps to ensure that the integrity of this material is preserved by the appropriate technical, physical and procedural safeguards.

Dependencies:

ACM_SCP.1 TOE CM coverage

ALC_DVS.2 Sufficiency of security measures

Developer action elements:

ACM_CAP.5.1D The developer shall use a CM system.

ACM_CAP.5.2D The developer shall provide CM documentation.

Content and presentation of evidence elements:

ACM_CAP.5.1C The CM system shall provide a unique reference for the TOE.

ACM_CAP.5.2C The CM documentation shall include a configuration list, a CM plan, an acceptance plan**, and integration procedures.**

ACM_CAP.5.3C The configuration list shall describe the configuration items that comprise the TOE.

ACM_CAP.5.4C The CM documentation shall describe the method used to uniquely identify the configuration items.

ACM_CAP.5.5C The CM system shall uniquely identify all configuration items.

ACM_CAP.5.6C The CM plan shall describe how the CM system is used.

ACM_CAP.5.7C The evidence shall demonstrate that the CM system is operating in accordance with the CM plan.

ACM_CAP.5.8C The CM documentation shall provide evidence that all configuration items have been and are being effectively maintained under the CM system.

ACM_CAP.5.9C The CM system shall provide measures such that only authorised changes are made to the configuration items.

ACM_CAP.5.10C The CM system shall support the generation of the TOE.

ACM_CAP.5.11C The acceptance plan shall describe the procedures used to accept modified or newly created configuration items as part of the TOE.

D R A F T

ACM_CAP.5.12C **The integration procedures shall describe how the CM system is applied in the TOE manufacturing process.**

ACM_CAP.5.13C **The CM system shall require that the person responsible for accepting a configuration item into CM is not the person who developed it.**

ACM_CAP.5.14C **The CM system shall clearly identify the configuration items that comprise the TSF.**

ACM_CAP.5.15C **The CM system shall support the audit of all modifications to the TOE, including as a minimum the originator, date, and time in the audit trail.**

ACM_CAP.5.16C **The CM system shall be able to identify the master copy of all material used to generate the TOE.**

ACM_CAP.5.17C **The evidence shall demonstrate that the use of the CM system, together with the development security measures, allow only authorised changes to be made to the TOE.**

ACM_CAP.5.18C **The evidence shall demonstrate that the use of the integration procedures ensure that the introduction of modifications into the TSF is performed in a controlled and complete manner.**

ACM_CAP.5.19C **The evidence shall demonstrate that the CM system is sufficient to ensure that the person responsible for accepting a configuration item into CM is not the person who developed it.**

ACM_CAP.5.20C **The evidence shall justify that the acceptance procedures provide for an adequate and appropriate review of changes to all configuration items.**

Evaluator action elements:

ACM_CAP.5.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

D R A F T

ACM_SCP CM scope

Objectives

243 The objective is to ensure that all necessary TOE configuration items are tracked by the CM system. This helps to ensure that the integrity of these configuration items is protected through the capabilities of the CM system.

244 The objectives of this family include the following:

a) ensuring that the TOE implementation representation is tracked;

b) ensuring that all necessary documentation, including problem reports, are tracked during development and operation;

c) ensuring that configuration options (e.g. compiler switches) are tracked; and

d) ensuring that development tools are tracked.

Component levelling

245 The components in this family are levelled on the basis of which of the following are tracked by the CM system: the TOE implementation representation; design documentation; test documentation; user documentation; administrator documentation; CM documentation; security flaws; and development tools.

Application notes

246 ACM_SCP.1.1C introduces the requirement that the TOE implementation representation be tracked by the CM system. The TOE implementation representation refers to all hardware, software, and firmware that comprise the physical TOE. In the case of a software-only TOE, the implementation representation may consist solely of source and object code.

247 ACM_SCP.1.1C also introduces the requirement that the CM documentation be tracked by the CM system. This includes documentation with respect to the CM plan, as well as information on the current versions of any tools that comprise the CM system.

248 ACM_SCP.2.1C introduces the requirement that security flaws be tracked by the CM system. This requires that information regarding previous security flaws and their resolution be maintained, as well as details regarding current security flaws.

249 ACM_SCP.3.1C introduces the requirement that development tools and other related information be tracked by the CM system. Examples of development tools are programming languages and compilers. Information pertaining to TOE generation items (such as compiler options, installation/generation options, and build options) is an example of information relating to development tools.

D R A F T

ACM_SCP.1 TOE CM coverage

Objectives

250 A CM system can control changes only to those items that have been placed under CM. Placing the TOE implementation representation, design, tests, user and administrator documentation, and CM documentation under CM provides assurance that they have been modified in a controlled manner with proper authorisations.

Dependencies:

ACM_CAP.3 Authorisation controls

Developer action elements:

ACM_SCP.1.1D **The developer shall provide CM documentation.**

Content and presentation of evidence elements:

ACM_SCP.1.1C **As a minimum, the following shall be tracked by the CM system: the TOE implementation representation, design documentation, test documentation, user documentation, administrator documentation, and CM documentation.**

ACM_SCP.1.2C **The CM documentation shall describe how configuration items are tracked by the CM system.**

Evaluator action elements:

ACM_SCP.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ACM_SCP.2 Problem tracking CM coverage

Objectives

251 A CM system can control changes only to those items that have been placed under CM. Placing the TOE implementation representation, design, tests, user and administrator documentation, and CM documentation under CM provides assurance that they have been modified in a controlled manner with proper authorisations.

252 The ability to track security flaws under CM ensures that security flaw reports are not lost or forgotten, and allows a developer to track security flaws to their resolution.

Dependencies:

ACM_CAP.3 Authorisation controls

Developer action elements:

ACM_SCP.2.1D The developer shall provide CM documentation.

Content and presentation of evidence elements:

ACM_SCP.2.1C As a minimum, the following shall be tracked by the CM system: the TOE implementation representation, design documentation, test documentation, user documentation, administrator documentation, CM documentation**, and security flaws.**

ACM_SCP.2.2C The CM documentation shall describe how configuration items are tracked by the CM system.

Evaluator action elements:

ACM_SCP.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ACM_SCP.3 Development tools CM coverage

Objectives

253 A CM system can control changes only to those items that have been placed under CM. Placing the TOE implementation representation, design, tests, user and administrator documentation, and CM documentation under CM provides assurance that they have been modified in a controlled manner with proper authorisations.

254 The ability to track security flaws under CM ensures that security flaw reports are not lost or forgotten, and allows a developer to track security flaws to their resolution.

255 Development tools play an important role in ensuring the production of a quality version of the TSF. Therefore, it is important to control modifications to these tools.

Dependencies:

ACM_CAP.3 Authorisation controls

Developer action elements:

ACM_SCP.3.1D The developer shall provide CM documentation.

Content and presentation of evidence elements:

ACM_SCP.3.1C As a minimum, the following shall be tracked by the CM system: the TOE implementation representation, design documentation, test documentation, user documentation, administrator documentation, CM documentation, security flaws**, and development tools and related information.**

D R A F T

ACM_SCP.3.2C The CM documentation shall describe how configuration items are tracked by the CM system.

Evaluator action elements:

ACM_SCP.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

D R A F T

Class ADO

Delivery and operation

256 Delivery and operation provides requirements for correct delivery, installation, generation, and start-up of the TOE.

257 Figure 5.2 shows the families within this class, and the hierarchy of components within the families.

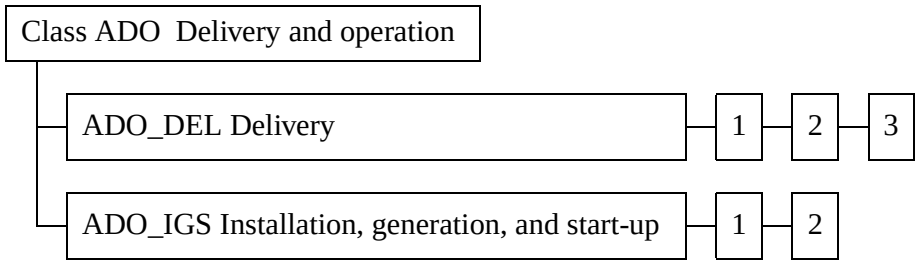

Figure 5.2 -Delivery and operation class decomposition

ADO_DEL Delivery

Objectives

258 The requirements for delivery call for system control and distribution facilities and procedures that provide assurance that the recipient receives the TOE that the sender intended to send, without any modifications. For a valid delivery, what is received must correspond precisely to the TOE master copy, thus avoiding any tampering with the actual version, or substitution of a false version.

Component levelling

259 The components in this family are levelled on the basis of increasing requirements on the developer to detect and prevent modifications to the TOE during delivery.

ADO_DEL.1 Delivery procedures

Dependencies:

No dependencies.

Developer action elements:

ADO_DEL.1.1D **The developer shall document procedures for delivery of the TOE or parts of it to the user.**

ADO_DEL.1.2D **The developer shall use the delivery procedures.**

Content and presentation of evidence elements:

ADO_DEL.1.1C **The delivery documentation shall describe all procedures which are necessary to maintain security when distributing versions of the TOE to a user's site.**

Evaluator action elements:

ADO_DEL.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ADO_DEL.2 Detection of modification

Dependencies:

ACM_CAP.3 Authorisation controls

Developer action elements:

ADO_DEL.2.1D The developer shall document procedures for delivery of the TOE or parts of it to the user.

ADO_DEL.2.2D The developer shall use the delivery procedures.

Content and presentation of evidence elements:

ADO_DEL.2.1C The delivery documentation shall describe all procedures which are necessary to maintain security when distributing versions of the TOE to a user's site.

ADO_DEL.2.2C **The delivery documentation shall describe how the various procedures and technical measures provide for the detection of modifications, or any discrepancy between the developer's master copy and the version received at the user site.**

ADO_DEL.2.3C **The delivery documentation shall describe how the various procedures allow detection of attempted masquerading even in cases in which the developer has sent nothing to the user's site.**

Evaluator action elements:

ADO_DEL.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADO_DEL.3 Prevention of modification

Dependencies:

ACM_CAP.3 Authorisation controls

Developer action elements:

ADO_DEL.3.1D The developer shall provide document procedures for delivery of the TOE or parts of it to the user.

ADO_DEL.3.2D The developer shall use the delivery procedures.

Content and presentation of evidence elements:

ADO_DEL.3.1C The delivery documentation shall describe all procedures which are necessary to maintain security when distributing versions of the TOE to a user's site.

ADO_DEL.3.2C The delivery documentation shall describe how the various procedures and technical measures provide for the **prevention** of modifications, or any discrepancy between the developer's master copy and the version received at the user site.

ADO_DEL.3.3C The delivery documentation shall describe how the various procedures allow detection of attempted masquerading even in cases in which the developer has sent nothing to the user's site.

Evaluator action elements:

ADO_DEL.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADO_IGS Installation, generation, and start-up

Objectives

260 Installation, generation, and start-up procedures are useful for ensuring that the TOE has been installed, generated, and started up in a secure manner as intended by the developer.

Component levelling

261 The components in this family are levelled on the basis of whether the TOE generation options are logged.

Application notes

262 The generation requirements are applicable only to TOEs that provide the ability to generate an operational TOE from source or object code.

263 The installation, generation, and start-up procedures may exist as a separate document, but would typically be grouped with other administrative guidance.

ADO_IGS.1 Installation, generation, and start-up procedures

Dependencies:

AGD_ADM.1 Administrator guidance

Developer action elements:

ADO_IGS.1.1D **The developer shall document procedures to be used for the secure installation, generation, and start-up of the TOE.**

Content and presentation of evidence elements:

ADO_IGS.1.1C **The documentation shall describe the steps necessary for secure installation, generation, and start-up of the TOE.**

Evaluator action elements:

ADO_IGS.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ADO_IGS.1.2E **The evaluator shall confirm that the installation procedures result in a secure configuration.**

ADO_IGS.2 Generation log

Dependencies:

AGD_ADM.1 Administrator guidance

Developer action elements:

ADO_IGS.2.1D The developer shall document procedures to be used for the secure installation, generation, and start-up of the TOE.

Content and presentation of evidence elements:

ADO_IGS.2.1C The documentation shall describe the steps necessary for secure installation, generation, and start-up of the TOE.

ADO_IGS.2.2C **The documentation shall describe procedures capable of creating a log containing the generation options used to generate the TOE in such a way that it is possible to determine exactly how and when the TOE was generated.**

Evaluator action elements:

ADO_IGS.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence**.**

ADO_IGS.2.2E The evaluator shall confirm that the installation procedures result in a secure configuration.

D R A F T

Class ADV

Development

264 The development class encompasses four families of requirements for representing the TSF at various levels of abstraction from the functional interface to the implementation representation. The development class also includes a family of requirements for a correspondence mapping between the various TSF representations, ultimately requiring a demonstration of correspondence from the least abstract representation through all intervening representations to the TOE summary specification provided in the ST. In addition, there is a family of requirements for a TSP model, and for correspondence mappings between the TSP, the TSP model, and the functional specification. Finally, there is a family of requirements on the internal structure of the TSF, which covers aspects such as modularity, layering, and minimisation of complexity.

265 Figure 5.3 shows the families within this class, and the hierarchy of components within the families.

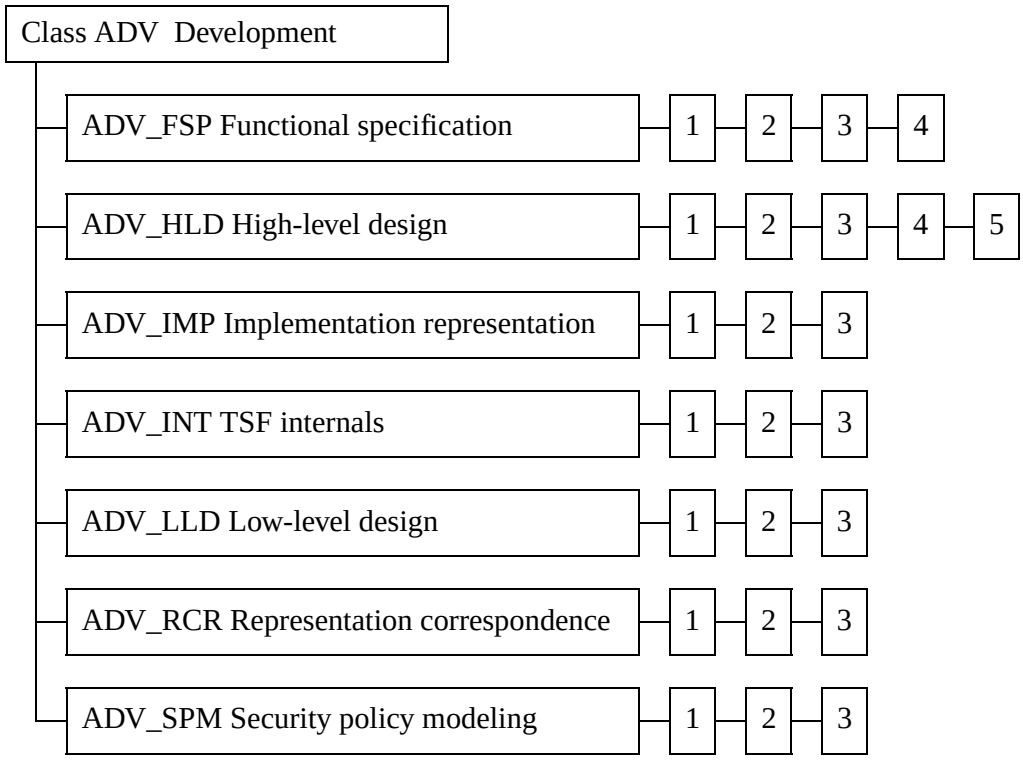

Figure 5.3 - Development class decomposition

266 The paradigm evident for these families is one of a functional specification of the TSF, decomposing the TSF into subsystems, decomposing the subsystems into modules, showing the implementation of the modules, and demonstration of correspondence between all decompositions that are provided as evidence. The requirements for the various TSF representations are separated into different families, however, to allow the PP/ST author to specify which subset of the TSF representations are required.

D R A F T

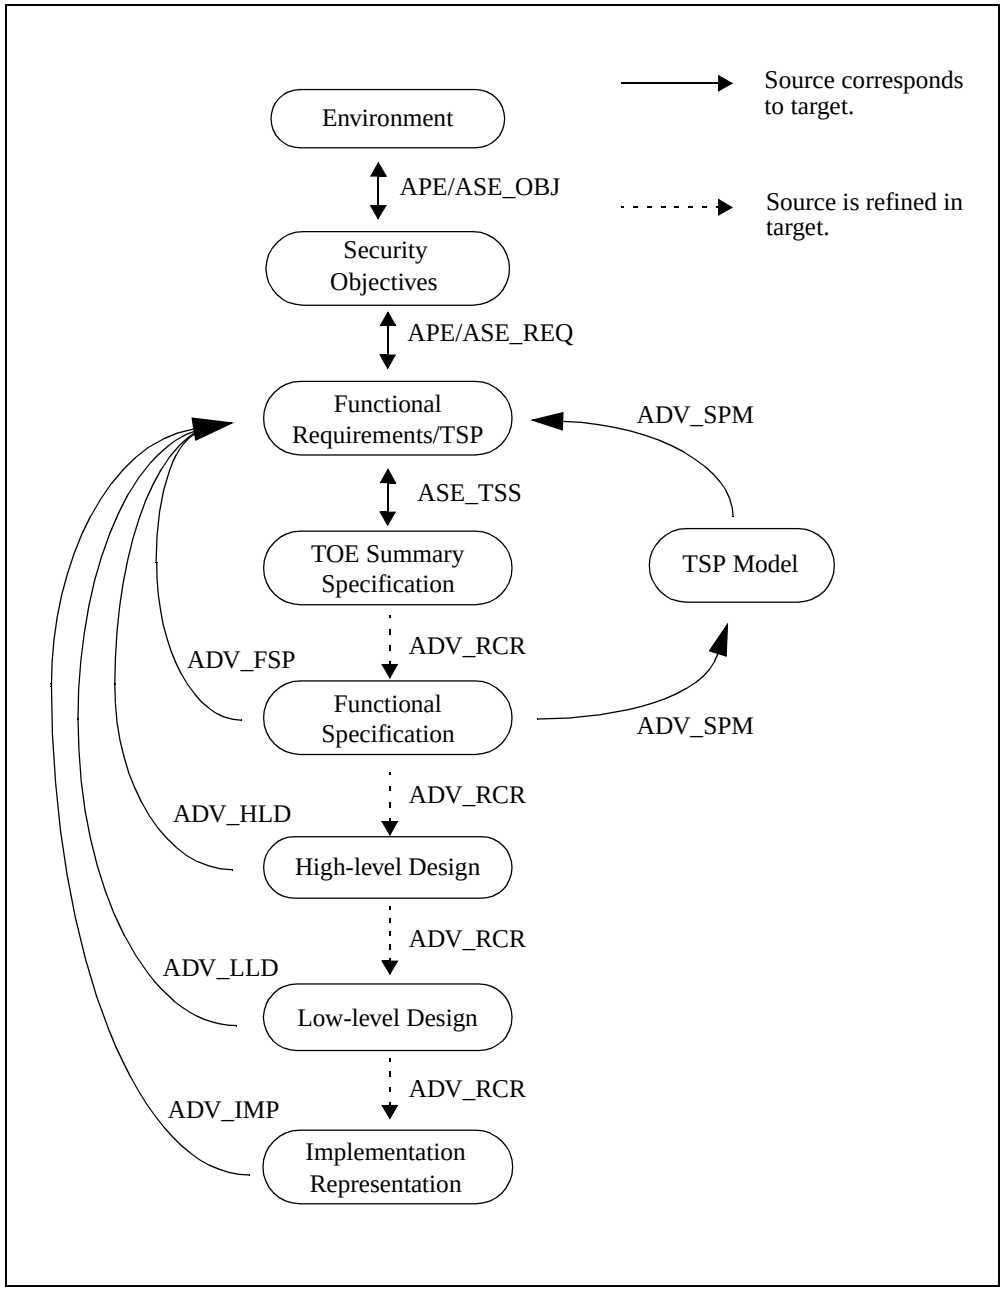

Figure 5.4 - Relationships between TOE representations and requirements

267 Figure 5.4 indicates the relationships between the various TSF representations and the objectives and requirements that they are intended to address. As the figure indicates, the Protection Profile evaluation (APE) and/or the Security Target evaluation (ASE) classes define the requirements for the correspondence between the functional requirements and the IT security objectives as well as between the IT security objectives and the TOE's anticipated environment. Class ASE also defines

requirements for the correspondence between both the IT security objectives and functional requirements and the TOE summary specification.

268 The requirements for all other correspondence shown in Figure 5.4 are defined in the ADV class. The ADV_SPM family defines the requirements for correspondence between the TSP and the TSP model, and between the TSP model and the functional specification. The ADV_RCR family defines the requirements for correspondence between all available TSF representations from the TOE summary specification through the implementation representation. Finally, each assurance family specific to a TSF representation (i.e. ADV_FSP, ADV_HLD, ADV_LLD and ADV_IMP) defines requirements relating that TSF representation to the functional requirements, the combination of which helps to ensure that the TOE security functional requirements have been addressed. The traceability analysis is always to be performed from the highest-level TSF representation down through each of the TSF representations that are provided. The CC captures this traceability requirement via dependencies on the ADV_RCR family.

Application notes

269 The TOE security policy (TSP) is the set of rules that regulate how resources are managed, protected and distributed within a TOE, expressed by the TOE security functional requirements. The developer is not explicitly required to provide a TSP, since the TSP is expressed by the TOE security functional requirements, through a combination of security function policies (SFPs) and the other individual requirement elements.

270 The TOE security functions (TSF) are all parts of the TOE which have to be relied upon for enforcement of the TSP. The TSF includes both functions which directly enforce the TSP, and also those functions which, while not directly enforcing the TSP, contribute to the enforcement of the TSP in a more indirect manner.

271 Although the requirements within the ASE_TSS family and within several families of this class call for several different TSF representations, it is not absolutely necessary for each and every TSF representation to be in a separate document. Indeed, it may be the case that a single document meets the documentation requirements for more than one TSF representation, since it is the information about each of these TSF representations that is required, rather than the resulting document structure. In cases where multiple TSF representations are combined within a single document, the developer should indicate which documents meet which requirements.

272 Three types of specification style are mandated by this class: informal, semiformal and formal. The functional specification, high-level design, low-level design and TSP models will be written using one or more of these specification styles. Ambiguity in these specifications is reduced by using an increased level of formality.

273 An informal specification is written as prose in natural language. Natural language is used here as meaning communication in any commonly spoken tongue (e.g. Dutch, English, French, German). An informal specification is not subject to any

notational or special restrictions other than those required as ordinary conventions for that language (e.g. grammar and syntax). While no notational restrictions apply, the informal specification is also required to provide defined meanings for terms which are used in a context other than that accepted by normal usage.

274 A semiformal specification is written in a restricted syntax language and is typically accompanied by supporting explanatory (informal) prose. The restricted syntax language may be a natural language with restricted sentence structure and keywords with special meanings, or it may be diagrammatic (e.g. data-flow diagrams, state transition diagrams, entity-relationship diagrams, data structure diagrams, and process or program structure diagrams). Whether based on diagrams or natural language, a set of conventions must be supplied to define the restrictions placed on the syntax.

275 A formal specification is written in a notation based upon well-established mathematical concepts, and is typically accompanied by supporting explanatory (informal) prose. These mathematical concepts are used to define the syntax and semantics of the notation and the proof rules which support logical reasoning. The syntactic and semantic rules supporting a formal notation should define how to recognise constructs unambiguously and determine their meaning. There needs to be evidence that it is impossible to derive contradictions, and all rules supporting the notation need to be defined or referenced.

276 Significant assurance can be gained by ensuring that the TSF can be traced though each of its representations, and by ensuring that the TSP model corresponds to the functional specification. The ADV_RCR family contains requirements for correspondence mappings between the various TSF representations, and the ADV_SPM family contains requirements for a correspondence mapping between the TSP model and the functional specification. A correspondence can take the form of an informal demonstration, a semiformal demonstration, or a formal proof.

277 When an informal demonstration of correspondence is required, this means that only a basic correspondence is required. Correspondence methods include, for example, the use of a 2-dimensional table with entries denoting correspondence, or the use of appropriate notation of design diagrams. Pointers and references to other documents may also be used.

278 A semiformal demonstration of correspondence requires a structured approach at the analysis of the correspondence. This approach should lessen ambiguity that could exist in an informal correspondence by limiting the interpretation of the terms included in the correspondence. Pointers and references to other documents may be used.

279 A formal proof of correspondence requires that well-established mathematical concepts be used to define the syntax and semantics of the formal notation and the proof rules which support logical reasoning. The security properties need to be expressible in the formal specification language, and these security properties need to be shown to be satisfied by the formal specification. Pointers and references to other documents may also be used.

280 The ADV_RCR.*.1C elements require that the developer provide evidence, for each adjacent pair of TSF representations, that all relevant security functionality of the more abstract TSF representation is refined in the less abstract TSF representation. The ADV_FSP.*.2E, ADV_HLD.*.2E, ADV_LLD.*.2E and ADV_IMP.*.2E elements each require the evaluator to determine that the TSF represented by that family of requirements is an accurate and complete instantiation of the TOE security functional requirements. In order to determine that a TSF representation is an accurate and complete instantiation of the TOE security functional requirements, it is intended that the evaluator use the evidence provided by the developer in ADV_RCR.*.1C as an input to this determination. By establishing a correspondence between the TOE security functional requirements and each of successive TSF representations down the chain, this step-wise process will ultimately provide more assurance that the least abstract TSF representation corresponds to the TOE security functional requirements, which is the ultimate goal of this class. If the evaluator makes no correspondence determinations back to the TOE security functional requirements for intermediate TSF representations, then trying to determine the correspondence from the least abstract TSF representation back to the TOE security functional requirements may represent too large a step to be accurately performed. Finally, depending on the set of TSF representations that are required, it is quite possible that the low-level design, high-level design, or even the functional specification might be the least abstract TSF representation that is provided.

D R A F T

ADV_FSP Functional specification

Objectives

281 The functional specification is a high-level description of the user-visible interface and behaviour of the TSF. It is an instantiation of the TOE security functional requirements. The functional specification has to show that all the TOE security functional requirements are addressed.

Component levelling

282 The components in this family are levelled on the basis of the degree of formalism required of the functional specification, and the degree of detail provided for the external interfaces to the TSF.

Application notes

283 The ADV_FSP.*.2E elements within this family define a requirement that the evaluator determine that the functional specification is an accurate and complete instantiation of the TOE security functional requirements. This provides a direct correspondence between the TOE security functional requirements and the functional specification, in addition to the pairwise correspondences required by the ADV_RCR family. It is expected that the evaluator will use the evidence provided in ADV_RCR as an input to making this determination, and the requirement for completeness is intended to be relative to the level of abstraction of the functional specification.

ADV_FSP.1 Informal functional specification

Dependencies:

ADV_RCR.1 Informal correspondence demonstration

Developer action elements:

ADV_FSP.1.1D **The developer shall provide a functional specification.**

Content and presentation of evidence elements:

ADV_FSP.1.1C **The functional specification shall describe the TSF and its external interfaces using an informal style.**

ADV_FSP.1.2C **The functional specification shall be internally consistent.**

ADV_FSP.1.3C **The functional specification shall include a presentation of syntax and semantics of all external TSF interfaces.**

ADV_FSP.1.4C **The functional specification shall include evidence that demonstrates that the TSF is completely represented.**

Evaluator action elements:

ADV_FSP.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ADV_FSP.1.2E **The evaluator shall determine that the functional specification is an accurate and complete instantiation of the TOE security functional requirements.**

ADV_FSP.2 Fully defined external interfaces

Dependencies:

ADV_RCR.1 Informal correspondence demonstration

Developer action elements:

ADV_FSP.2.1D The developer shall provide a functional specification.

Content and presentation of evidence elements:

ADV_FSP.2.1C The functional specification shall describe the TSF and its external interfaces using an informal style.

ADV_FSP.2.2C The functional specification shall be internally consistent.

ADV_FSP.2.3C The functional specification shall include a presentation of syntax**, effects, exceptions, error messages** and semantics of all external TSF interfaces.

ADV_FSP.2.4C The functional specification shall include evidence that demonstrates that the TSF is completely represented.

Evaluator action elements:

ADV_FSP.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_FSP.2.2E The evaluator shall determine that the functional specification is an accurate and complete instantiation of the TOE security functional requirements.

ADV_FSP.3 Semiformal functional specification

Dependencies:

ADV_RCR.1 Informal correspondence demonstration

Developer action elements:

ADV_FSP.3.1D The developer shall provide a functional specification.

Content and presentation of evidence elements:

ADV_FSP.3.1C The functional specification shall describe the TSF and its external interfaces using a **semiformal** style**, supported by informal, explanatory text where appropriate.**

ADV_FSP.3.2C The functional specification shall be internally consistent.

ADV_FSP.3.3C The functional specification shall include a presentation of syntax, effects, exceptions, error messages, and semantics of all external TSF interfaces.

ADV_FSP.3.4C The functional specification shall include evidence that demonstrates that the TSF is completely represented.

Evaluator action elements:

ADV_FSP.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_FSP.3.2E The evaluator shall determine that the functional specification is an accurate and complete instantiation of the TOE security functional requirements.

ADV_FSP.4 Formal functional specification

Dependencies:

ADV_RCR.1 Informal correspondence demonstration

Developer action elements:

ADV_FSP.4.1D The developer shall provide a functional specification.

Content and presentation of evidence elements:

ADV_FSP.4.1C The functional specification shall describe the TSF and its external interfaces using a **formal** style, supported by informal, explanatory text where appropriate.

ADV_FSP.4.2C The functional specification shall be internally consistent.

ADV_FSP.4.3C The functional specification shall include a presentation of syntax, effects, exceptions, error messages, and semantics of all external TSF interfaces.

ADV_FSP.4.4C The functional specification shall include evidence that demonstrates that the TSF is completely represented.

Evaluator action elements:

ADV_FSP.4.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_FSP.4.2E The evaluator shall determine that the functional specification is an accurate and complete instantiation of the TOE security functional requirements.

D R A F T

ADV_HLD High-level design

Objectives

284 The high-level design of a TOE provides a description of the TSF in terms of major structural units (i.e. subsystems) and relates these units to the functions that they provide. The high-level design requirements are intended to provide assurance that the TOE provides an architecture appropriate to implement the claimed functional requirements.

285 The high-level design refines the functional specification into subsystems. For each subsystem of the TSF, the high-level design describes its purpose and function, and identifies the security functions contained in the subsystem. The interrelationships of all subsystems are also defined in the high-level design. These interrelationships will be represented as external interfaces for data flow, control flow, etc., as appropriate.

Component levelling

286 The components in this family are levelled on the basis of the degree of formalism required of the high-level design, and on the degree of detail required for the interface specifications.

Application notes

287 The developer is expected to describe the design of the TSF in terms of subsystems. The term “subsystem” is used here to express the idea of decomposing the TSF into a relatively small number of parts. While the developer is not required to actually have “subsystems”, the developer is expected to represent a similar level of decomposition. For example, a design may be similarly decomposed using “layers”, “domains”, or “servers”.

288 The term “security functionality” is used to represent the set of operations that a subsystem performs in contribution to security functions implemented by the TOE. This distinction is made because design constructs, such as subsystems and modules, do not necessarily relate to specific security functions. While a given subsystem may correspond directly to a security function, or even multiple security functions, it is also possible that many subsystems must be combined to implement a single security function.

289 The term “TSP enforcing subsystem” refers to a subsystem that contributes to the enforcement of the TSP.

290 The ADV_HLD.*.2E elements within this family define a requirement that the evaluator determine that the high-level design is an accurate and complete instantiation of the TOE security functional requirements. This provides a direct correspondence between the TOE security functional requirements and the high-level design, in addition to the pairwise correspondences required by the ADV_RCR family. It is expected that the evaluator will use the evidence provided in ADV_RCR as an input to making this determination, and the requirement for

completeness is intended to be relative to the level of abstraction of the high-level design.

ADV_HLD.1 Descriptive high-level design

Dependencies:

ADV_FSP.1 Informal functional specification

ADV_RCR.1 Informal correspondence demonstration

Developer action elements:

ADV_HLD.1.1D **The developer shall provide the high-level design of the TSF.**

Content and presentation of evidence elements:

ADV_HLD.1.1C **The presentation of the high-level design shall be informal.**

ADV_HLD.1.2C **The high-level design shall be internally consistent.**

ADV_HLD.1.3C **The high-level design shall describe the structure of the TSF in terms of subsystems.**

ADV_HLD.1.4C **The high-level design shall describe the security functionality provided by each subsystem of the TSF.**

ADV_HLD.1.5C **The high-level design shall identify any underlying hardware, firmware, and/or software required by the TSF with a presentation of the functions provided by the supporting protection mechanisms implemented in that hardware, firmware, or software.**

ADV_HLD.1.6C **The high-level design shall identify all interfaces to the subsystems of the TSF.**

ADV_HLD.1.7C **The high-level design shall identify which of the interfaces to the subsystems of the TSF are externally visible.**

Evaluator action elements:

ADV_HLD.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ADV_HLD.1.2E **The evaluator shall determine that the high-level design is an accurate and complete instantiation of the TOE security functional requirements.**

ADV_HLD.2 Security enforcing high-level design

Dependencies:

ADV_FSP.1 Informal functional specification

ADV_RCR.1 Informal correspondence demonstration

Developer action elements:

ADV_HLD.2.1D The developer shall provide the high-level design of the TSF.

Content and presentation of evidence elements:

ADV_HLD.2.1C The presentation of the high-level design shall be informal.

ADV_HLD.2.2C The high-level design shall be internally consistent.

ADV_HLD.2.3C The high-level design shall describe the structure of the TSF in terms of subsystems.

ADV_HLD.2.4C The high-level design shall describe the security functionality provided by each subsystem of the TSF.

ADV_HLD.2.5C The high-level design shall identify any underlying hardware, firmware, and/or software required by the TSF with a presentation of the functions provided by the supporting protection mechanisms implemented in that hardware, firmware, or software.

ADV_HLD.2.6C The high-level design shall identify all interfaces to the subsystems of the TSF.

ADV_HLD.2.7C The high-level design shall identify which of the interfaces to the subsystems of the TSF are externally visible.

ADV_HLD.2.8C **The high-level design shall include a presentation of syntax and semantics for all of the interfaces to the subsystems of the TSF.**

ADV_HLD.2.9C **The high-level design shall describe the separation of the TSF into TSP enforcing and other subsystems.**

Evaluator action elements:

ADV_HLD.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_HLD.2.2E The evaluator shall determine that the high-level design is an accurate and complete instantiation of the TOE security functional requirements.

ADV_HLD.3 Semiformal high-level design

Dependencies:

ADV_FSP.3 Semiformal functional specification

ADV_RCR.2 Semiformal correspondence demonstration

Developer action elements:

ADV_HLD.3.1D The developer shall provide the high-level design of the TSF.

Content and presentation of evidence elements:

ADV_HLD.3.1C The presentation of the high-level design shall be **semiformal**.

ADV_HLD.3.2C The high-level design shall be internally consistent.

ADV_HLD.3.3C The high-level design shall describe the structure of the TSF in terms of subsystems.

ADV_HLD.3.4C The high-level design shall describe the security functionality provided by each subsystem of the TSF.

ADV_HLD.3.5C The high-level design shall identify any underlying hardware, firmware, and/or software required by the TSF with a presentation of the functions provided by the supporting protection mechanisms implemented in that hardware, firmware, or software.

ADV_HLD.3.6C The high-level design shall identify all interfaces to the subsystems of the TSF.

ADV_HLD.3.7C The high-level design shall identify which of the interfaces to the subsystems of the TSF are externally visible.

ADV_HLD.3.8C The high-level design shall include a presentation of syntax**, effects, exceptions, error messages** and semantics for all of the interfaces to the subsystems of the TSF.

ADV_HLD.3.9C The high-level design shall describe the separation of the TSF into TSP enforcing and other subsystems.

Evaluator action elements:

ADV_HLD.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_HLD.3.2E The evaluator shall determine that the high-level design is an accurate and complete instantiation of the TOE security functional requirements.

ADV_HLD.4 Semiformal high-level explanation

Dependencies:

ADV_FSP.3 Semiformal functional specification

ADV_RCR.2 Semiformal correspondence demonstration

Developer action elements:

ADV_HLD.4.1D The developer shall provide the high-level design of the TSF.

Content and presentation of evidence elements:

ADV_HLD.4.1C The presentation of the high-level design shall be semiformal.

ADV_HLD.4.2C The high-level design shall be internally consistent.

ADV_HLD.4.3C The high-level design shall describe the structure of the TSF in terms of subsystems.

ADV_HLD.4.4C The high-level design shall describe the security functionality provided by each subsystem of the TSF.

ADV_HLD.4.5C The high-level design shall identify any underlying hardware, firmware, and/or software required by the TSF with a presentation of the functions provided by the supporting protection mechanisms implemented in that hardware, firmware, or software.

ADV_HLD.4.6C The high-level design shall identify all interfaces to the subsystems of the TSF.

ADV_HLD.4.7C The high-level design shall identify which of the interfaces to the subsystems of the TSF are externally visible.

ADV_HLD.4.8C The high-level design shall include a presentation of syntax, effects, exceptions, error messages and semantics for all of the interfaces to the subsystems of the TSF.

ADV_HLD.4.9C The high-level design shall describe the separation of the TSF into TSP enforcing and other subsystems.

ADV_HLD.4.10C **The high-level design shall justify that the identified means of achieving separation, including any protection mechanisms, are sufficient to ensure a clear and effective separation of TSP enforcing from non-TSP enforcing functions.**

ADV_HLD.4.11C **The high-level design shall justify that the TSF mechanisms are sufficient to implement the security functions identified in the high-level design.**

Evaluator action elements:

ADV_HLD.4.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_HLD.4.2E The evaluator shall determine that the high-level design is an accurate and complete instantiation of the TOE security functional requirements.

ADV_HLD.5 Formal high-level design

Dependencies:

ADV_FSP.4 Formal functional specification

ADV_RCR.3 Formal correspondence demonstration

Developer action elements:

ADV_HLD.5.1D The developer shall provide the high-level design of the TSF.

D R A F T

Content and presentation of evidence elements:

ADV_HLD.5.1C The presentation of the high-level design shall be **formal**.

ADV_HLD.5.2C The high-level design shall be internally consistent.

ADV_HLD.5.3C The high-level design shall describe the structure of the TSF in terms of subsystems.

ADV_HLD.5.4C The high-level design shall describe the security functionality provided by each subsystem of the TSF.

ADV_HLD.5.5C The high-level design shall identify any underlying hardware, firmware, and/or software required by the TSF with a presentation of the functions provided by the supporting protection mechanisms implemented in that hardware, firmware, or software.

ADV_HLD.5.6C The high-level design shall identify all interfaces to the subsystems of the TSF.

ADV_HLD.5.7C The high-level design shall identify which of the interfaces to the subsystems of the TSF are externally visible.

ADV_HLD.5.8C The high-level design shall include a presentation of syntax, effects, exceptions, error messages and semantics for all of the interfaces to the subsystems of the TSF.

ADV_HLD.5.9C The high-level design shall describe the separation of the TSF into TSP enforcing and other subsystems.

ADV_HLD.5.10C The high-level design shall justify that the identified means of achieving separation, including any protection mechanisms, are sufficient to ensure a clear and effective separation of TSP enforcing from non-TSP enforcing functions.

ADV_HLD.5.11C The high-level design shall justify that the TSF mechanisms are sufficient to implement the security functions identified in the high-level design.

Evaluator action elements:

ADV_HLD.5.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_HLD.5.2E The evaluator shall determine that the high-level design is an accurate and complete instantiation of the TOE security functional requirements.

D R A F T

ADV_IMP Implementation representation

Objectives

291 The description of the implementation representation in the form of source code, firmware, hardware drawings, etc. captures the detailed internal workings of the TSF in support of analysis.

Component levelling

292 The components in this family are levelled on the basis of the completeness and structure of the implementation representation provided.

Application notes

293 The implementation representation is used to express the notion of the least abstract representation of the TSF, specifically the one that is used to create the TSF itself without further design refinement. Source code which is then compiled or a hardware drawing which is used to build the actual hardware are examples of parts of an implementation representation.

294 It is possible that evaluators may use the implementation representation to directly support other evaluation activities (e.g. vulnerability analysis, test coverage analysis, or identification of additional evaluator tests). It is expected that PP/ST authors will select a component that requires that the implementation is complete and comprehensive enough to address the needs of all other requirements included in the PP/ST.

ADV_IMP.1 Subset of the implementation of the TSF

Application notes

295 ADV_IMP.1.1D requires that the developer provide the implementation representation for a subset of the TSF. The intention is that access to at least a portion of the TSF will provide the evaluator with an opportunity to examine the implementation representation for those portions of the TOE where such an examination can add significantly to the understanding of, and assurance in, the mechanisms employed. Provision of a sample of the implementation representation will also allow the evaluator to sample the traceability evidence to gain assurance in the approach taken for refinement, and to assess the presentation of the implementation representation itself.

296 ADV_IMP.1.2E element defines a requirement that the evaluator determine that the least abstract TSF representation is an accurate and complete instantiation of the TOE security functional requirements. This provides a direct correspondence between the TOE security functional requirements and the least abstract TSF representation, in addition to the pairwise correspondences required by the ADV_RCR family. It is expected that the evaluator will use the evidence provided in ADV_RCR as an input to making this determination. The least abstract TSF representation for this component is an aggregate of the implementation

representation that is provided and that portion of the low-level design for which no corresponding implementation representation is provided.

Dependencies:

ADV_LLD.1 Descriptive low-level design

ADV_RCR.1 Informal correspondence demonstration

ALC_TAT.1 Well defined development tools

Developer action elements:

ADV_IMP.1.1D **The developer shall provide the implementation representation for a selected subset of the TSF.**

Content and presentation of evidence elements:

ADV_IMP.1.1C **The implementation representation shall unambiguously define the TSF to a level of detail such that the TSF can be generated without further design decisions.**

ADV_IMP.1.2C **The implementation representation shall be internally consistent.**

Evaluator action elements:

ADV_IMP.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ADV_IMP.1.2E **The evaluator shall determine that the least abstract TSF representation provided is an accurate and complete instantiation of the TOE security functional requirements.**

ADV_IMP.2 Implementation of the TSF

Application notes

297 The ADV_IMP.2.2E element defines a requirement that the evaluator determine that the implementation representation is an accurate and complete instantiation of the TOE security functional requirements. This provides a direct correspondence between the TOE security functional requirements and the implementation representation, in addition to the pairwise correspondences required by the ADV_RCR family. It is expected that the evaluator will use the evidence provided in ADV_RCR as an input to making this determination.

Dependencies:

ADV_LLD.1 Descriptive low-level design

Developer action elements:

ADV_IMP.3.1D The developer shall provide the implementation representation for the entire TSF.

Content and presentation of evidence elements:

ADV_IMP.3.1C The implementation representation shall unambiguously define the TSF to a level of detail such that the TSF can be generated without further design decisions.

ADV_IMP.3.2C The implementation representation shall be internally consistent.

ADV_IMP.3.3C The implementation representation shall describe the relationships between all portions of the implementation.

ADV_IMP.3.4C **The implementation representation shall be structured into small and comprehensible sections.**

Evaluator action elements:

ADV_IMP.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_IMP.3.2E The evaluator shall determine that the **implementation representation** is an accurate and complete instantiation of the TOE security functional requirements.

D R A F T

ADV_INT TSF internals

Objectives

299 This family addresses the internal structure of the TSF. Requirements are presented for modularity, layering (to separate levels of abstraction and minimise circular dependencies), minimisation of the complexity of policy enforcement mechanisms, and the minimisation of functions that are not TSP enforcing - thus resulting in a TSF that is simple enough to be analysed.

300 Modular design reduces the interdependence between elements of the TSF and thus reduces the risk that a change or error in one module will have effects throughout the TOE. Thus, a modular design provides the basis for determining the scope of interaction with other elements of the TSF, provides for increased assurance that unexpected effects do not occur, and also provides the basis for designing and evaluating test suites.

301 Design complexity affects how difficult it is to understand the design of the TOE. The simpler the design, the more assurance is gained that there are no undiscovered vulnerabilities in the design and that the high-level protection requirements are accurately and completely instantiated in the lower level design and the implementation.

302 Design complexity minimisation provides a part of the assurance that the code is understood; the less complex the code in the TSF, the greater the likelihood that the design of the TSF is comprehensible. Design complexity minimisation is a key characteristic of a reference validation mechanism.

Component levelling

303 The components in this family are levelled on the basis of the amount of structure and minimisation required.

Application notes

304 The term “portions of the TSF” is used to represent parts of the TSF with a varying granularity based on the available TSF representations. The functional specification allows identification in terms of interfaces, the high-level design allows identification in terms of subsystems, the low-level design allows identification in terms of modules, and the implementation representation allows identification in terms of implementation units (e.g. source code files).

305 The ADV_INT.2.5C and ADV_INT.3.5C elements address minimisation of mutual interactions between layers. Nevertheless, it is still permissible to have mutual interactions between layers, but in these cases the developer is required to demonstrate that these mutual interactions are necessary and cannot reasonably be avoided.

306 Several of the elements within the components for this family refer to the architectural description. The architectural description is at a similar level of

abstraction to the low-level design, in that it is concerned with the modules of the TSF. Whereas the low-level design describes the design of the modules of the TSF, the purpose of the architectural description is to provide evidence of modularity, layering, and minimisation of complexity of the TSF, as applicable. Both the low-level design and the implementation representation are required to be in compliance with the architectural description, to provide assurance that these TSF representations possess the required modularity, layering, and minimisation of complexity.

ADV_INT.1 Modularity

Dependencies:

ADV_IMP.1 Subset of the implementation of the TSF

ADV_LLD.1 Descriptive low-level design

Developer action elements:

ADV_INT.1.1D **The developer shall design the TSF in a modular fashion that avoids unnecessary interactions between the modules of the design.**

ADV_INT.1.2D **The developer shall provide an architectural description.**

Content and presentation of evidence elements:

ADV_INT.1.1C **The architectural description shall identify the modules of the TSF.**

ADV_INT.1.2C **The architectural description shall describe the purpose, interface, parameters, and effects of each module in the TSF.**

ADV_INT.1.3C **The architectural description shall describe how the TSF design provides for largely independent modules that avoid unnecessary interactions.**

Evaluator action elements:

ADV_INT.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ADV_INT.1.2E **The evaluator shall determine that both the low-level design and the implementation representation are in compliance with the architectural description.**

ADV_INT.2 Reduction of complexity

Application notes

307 This component introduces a reference monitor concept by requiring the minimisation of complexity of the portions of the TSF that enforce the access control and/or information flow control policies identified in the TSP.

Dependencies:

ADV_IMP.1 Subset of the implementation of the TSF

ADV_LLD.1 Descriptive low-level design

Developer action elements:

ADV_INT.2.1D The developer shall design and structure the TSF in a modular **and layered** fashion that avoids unnecessary interactions between the modules of the design**, minimises mutual interactions between the layers of the design, and minimises the complexity of the portions of the TSF that enforce any access control and/or information flow control policies**.

ADV_INT.2.2D The developer shall provide an architectural description.

Content and presentation of evidence elements:

ADV_INT.2.1C The architectural description shall identify the modules of the TSF **and shall specify which portions of the TSF enforce the access control and/or information flow control policies**.

ADV_INT.2.2C The architectural description shall describe the purpose, interface, parameters, and effects of each module of the TSF.

ADV_INT.2.3C The architectural description shall describe how the TSF design provides for largely independent modules that avoid unnecessary interactions.

ADV_INT.2.4C **The architectural description shall describe the layering architecture.**

ADV_INT.2.5C **The architectural description shall show that mutual interactions have been minimised, and justify those that remain.**

ADV_INT.2.6C **The architectural description shall describe how the portions of the TSF that enforce any access control and/or information flow control policies have been structured to minimise complexity.**

Evaluator action elements:

ADV_INT.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_INT.2.2E The evaluator shall determine that both the low-level design and the implementation representation are in compliance with the architectural description.

ADV_INT.3 Minimisation of complexity

Application notes

308 This component requires that the reference monitor property “simple enough to be analysed” is fully addressed. When this component is combined with the functional

requirements FPT_RVM.1 and FPT_SEP.3, the reference monitor concept would be fully realised.

Dependencies:

ADV_IMP.2 Implementation of the TSF

ADV_LLD.1 Descriptive low-level design

Developer action elements:

ADV_INT.3.1D The developer shall design and structure the TSF in a modular and layered fashion that avoids unnecessary interactions between the modules of the design, minimises mutual interactions between the layers of the design, and minimises the complexity of the **entire TSF**.

ADV_INT.3.2D The developer shall provide an architectural description.

ADV_INT.3.3D **The developer shall design and structure the portions of the TSF that enforce any access control and/or information flow control policies such that they are simple enough to be analysed.**

ADV_INT.3.4D **The developer shall ensure that functions whose objectives are not relevant for the TSF, are excluded from the TSF modules.**

Content and presentation of evidence elements:

ADV_INT.3.1C The architectural description shall identify the modules of the TSF and shall specify which portions of the TSF enforce the access control and/or information flow control policies.

ADV_INT.3.2C The architectural description shall describe the purpose, interface, parameters, and side-effects of each module of the TSF.

ADV_INT.3.3C The architectural description shall describe how the TSF design provides for largely independent modules that avoid unnecessary interactions.

ADV_INT.3.4C The architectural description shall describe the layering architecture.

ADV_INT.3.5C The architectural description shall show that mutual interactions have been minimised, and justify those that remain.

ADV_INT.3.6C The architectural description shall describe how the **entire TSF has** been structured to minimise complexity.

ADV_INT.3.7C **The architectural description shall justify the inclusion of any non TSP enforcing modules in the TSF.**

Evaluator action elements:

ADV_INT.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_INT.3.2E The evaluator shall determine that both the low-level design and the implementation representation are in compliance with the architectural description.

ADV_INT.3.3E **The evaluator shall confirm that the portions of the TSF that enforce any access control and/or information flow control policies are simple enough to be analysed.**

D R A F T

ADV_LLD Low-level design

Objectives

309 The low-level design of a TOE provides a description of the internal workings of the TSF in terms of modules and their interrelationships and dependencies. The low-level design provides assurance that the TSF subsystems have been correctly and effectively refined.

310 For each module of the TSF, the low-level design describes its purpose, function, interfaces, dependencies, and the implementation of any TSP enforcing functions.

Component levelling

311 The components in this family are levelled on the basis of the degree of formalism required of the low-level design, and on the degree of detail required for the interface specifications.

Application notes

312 The term “TSP enforcing module” refers to any module that contributes to TSP enforcement.

313 The term “security functionality” is used to represent the set of operations that a module performs in contribution to security functions implemented by the TOE. This distinction is made because modules do not necessarily relate to specific security functions. While a given module may correspond directly to a security function, or even multiple security functions, it is also possible that many modules must be combined to implement a single security function.

314 The ADV_LLD.*.6C elements require that the low-level design describe how each TSP-enforcing function is provided. The intent of this requirement is that the low-level design provide a description of how each module is expected to be implemented from a design perspective.

315 The ADV_LLD.*.2E elements within this family define a requirement that the evaluator determine that the low-level design is an accurate and complete instantiation of the TOE security functional requirements. This provides a direct correspondence between the TOE security functional requirements and the low-level design, in addition to the pairwise correspondences required by the ADV_RCR family. It is expected that the evaluator will use the evidence provided in ADV_RCR as an input to making this determination, and the requirement for completeness is intended to be relative to the level of abstraction of the low-level design.

Evaluator action elements:

ADV_LLD.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ADV_LLD.1.2E **The evaluator shall determine that the low-level design is an accurate and complete instantiation of the TOE security functional requirements.**

ADV_LLD.2 Semiformal low-level design

Dependencies:

ADV_HLD.3 Semiformal high-level design

ADV_RCR.2 Semiformal correspondence demonstration

Developer action elements:

ADV_LLD.2.1D The developer shall provide the low-level design of the TSF.

Content and presentation of evidence elements:

Content and presentation of evidence elements:

ADV_LLD.2.1C The presentation of the low-level design shall be **semiformal**.

ADV_LLD.2.2C The low-level design shall be internally consistent.

ADV_LLD.2.3C The low-level design shall describe the TSF in terms of modules.

ADV_LLD.2.4C The low-level design shall describe the purpose of each module.

ADV_LLD.2.5C The low-level design shall define the interrelationships between the modules in terms of provided security functionality and dependencies on other modules.

ADV_LLD.2.6C The low-level design shall describe how each TSP-enforcing function is provided.

ADV_LLD.2.7C The low-level design shall identify all interfaces to the modules of the TSF.

ADV_LLD.2.8C The low-level design shall identify which of the interfaces to the modules of the TSF are externally visible.

ADV_LLD.2.9C The low-level design shall include a presentation of syntax**, effects, exceptions, error messages** and semantics for all of the interfaces to the modules of the TSF.

ADV_LLD.2.10C The low-level design shall describe the separation of the TSF into TSP enforcing and other modules.

Evaluator action elements:

ADV_LLD.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_LLD.2.2E The evaluator shall determine that the low-level design is an accurate and complete instantiation of the TOE security functional requirements.

ADV_LLD.3 Formal low-level design

Dependencies:

ADV_HLD.5 Formal high-level design

ADV_RCR.3 Formal correspondence demonstration

Developer action elements:

ADV_LLD.3.1D The developer shall provide the low-level design of the TSF.

Content and presentation of evidence elements:

ADV_LLD.3.1C The presentation of the low-level design shall be **formal**.

ADV_LLD.3.2C The low-level design shall be internally consistent.

ADV_LLD.3.3C The low-level design shall describe the TSF in terms of modules.

ADV_LLD.3.4C The low-level design shall describe the purpose of each module.

ADV_LLD.3.5C The low-level design shall define the interrelationships between the modules in terms of provided security functionality and dependencies on other modules.

ADV_LLD.3.6C The low-level design shall describe how each TSP-enforcing function is provided.

ADV_LLD.3.7C The low-level design shall identify all interfaces to the modules of the TSF.

ADV_LLD.3.8C The low-level design shall identify which of the interfaces to the modules of the TSF are externally visible.

ADV_LLD.3.9C The low-level design shall include a presentation of syntax, effects, exceptions, error messages and semantics for all of the interfaces to the modules of the TSF.

ADV_LLD.3.10C The low-level design shall describe the separation of the TSF into TSP enforcing and other modules.

Evaluator action elements:

ADV_LLD.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_LLD.3.2E The evaluator shall determine that the low-level design is an accurate and complete instantiation of the TOE security functional requirements.

D R A F T

ADV_RCR Representation correspondence

Objectives

316 The correspondence between the various TSF representations (i.e. TOE summary specification, functional specification, high-level design, low-level design, implementation representation) addresses the correct and complete instantiation of the requirements to the least abstract TSF representation provided. This conclusion is achieved by step-wise refinement and the cumulative results of correspondence determinations between all adjacent abstractions of representation.

Component levelling

317 The components in this family are levelled on the basis of the level of rigour of the dependent TSF representations, and thus reflect the level of rigour that can be obtained in the correspondence between the various abstractions of TSF representation.

Application notes

318 The developer must demonstrate to the evaluator that the most detailed, or least abstract, TSF representation provided is an accurate, consistent, and complete instantiation of the functions expressed as functional requirements in the ST. This is accomplished by showing correspondence between adjacent representations at a commensurate level of rigour.

319 The evaluator must analyse each demonstration of correspondence between abstractions, as well as the results of the analysis of each TSF representation, and then make a determination as to whether the functional requirements in the ST have been satisfied.

320 This family of requirements is not intended to address correspondence relating to the TSP model or the TSP. Rather, as shown in Figure 5.4, it is intended to address correspondence between various TSF representations (i.e. the TOE summary specification, functional specification, high-level design, low-level design, and implementation representation) that are provided.

321 The ADV_RCR.*.1C elements refer to “all relevant security functionality” in defining the scope of what must be refined between an adjacent pair of TSF representations. For the refinements between the TOE summary specification and the functional specification, this element only requires that the TOE security functions in the TOE summary specification be refined in the functional specification, and does not require that the functional specification contain any details regarding assurance measures (which are presented in the TOE summary specification). Where the implementation representation is only provided for a subset of the TSF (as in ADV_IMP.1), the required refinements between the low-level design and the implementation representation are limited to the security functionality that is presented in the implementation representation. In all other cases, this element requires that all parts of the more abstract TSF representation be refined in the less abstract TSF representation.

D R A F T

ADV_RCR.1 Informal correspondence demonstration

Dependencies:

No dependencies.

Developer action elements:

ADV_RCR.1.1D **The developer shall provide an analysis of correspondence between all adjacent pairs of TSF representations that are provided.**

Content and presentation of evidence elements:

ADV_RCR.1.1C **For each adjacent pair of provided TSF representations, the analysis shall demonstrate that all relevant security functionality of the more abstract TSF representation is correctly and completely refined in the less abstract TSF representation.**

ADV_RCR.1.2C **For each adjacent pair of provided TSF representations, the demonstration of correspondence between the representations may be informal.**

Evaluator action elements:

ADV_RCR.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ADV_RCR.2 Semiformal correspondence demonstration

Dependencies:

No dependencies.

Developer action elements:

ADV_RCR.2.1D The developer shall provide an analysis of correspondence between all adjacent pairs of TSF representations that are provided.

Content and presentation of evidence elements:

ADV_RCR.2.1C For each adjacent pair of provided TSF representations, the analysis shall demonstrate that all relevant security functionality of the more abstract TSF representation is correctly and completely refined in the less abstract TSF representation.

ADV_RCR.2.2C For each adjacent pair of provided TSF representations, **where portions of either representation are informally specified,** the demonstration of correspondence between **those portions of the representations of** the representations may be informal.

ADV_RCR.2.3C **For each adjacent pair of provided TSF representations, where portions of both representations are at least semiformally specified, the demonstration of**

correspondence between those portions of the representations shall be semiformal.

Evaluator action elements:

ADV_RCR.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_RCR.3 Formal correspondence demonstration

Application notes

322 The developer must either demonstrate or prove correspondence, as described in the requirements below, commensurate with the level of rigour of presentation style. For example, correspondence must be proven when corresponding representations are formally specified.

Dependencies:

No dependencies.

Developer action elements:

ADV_RCR.3.1D The developer shall provide an analysis of correspondence between all adjacent pairs of TSF representations that are provided.

ADV_RCR.3.2D **For those corresponding portions of representations that are formally specified, the developer shall prove that correspondence.**

Content and presentation of evidence elements:

ADV_RCR.3.1C For each adjacent pair of provided TSF representations, the analysis shall **prove or** demonstrate that all relevant security functionality of the more abstract TSF representation is correctly and completely refined in the less abstract TSF representation.

ADV_RCR.3.2C For each adjacent pair of provided TSF representations, where portions of either representation are informally specified, the demonstration of correspondence between those portions of the representations of the representations may be informal.

ADV_RCR.3.3C For each adjacent pair of provided TSF representations, where portions of **one** representation are **semiformally specified and the other** at least semiformally specified, the demonstration of correspondence between those portions of the representations shall be semiformal.

ADV_RCR.3.4C **For each adjacent pair of provided TSF representations, where portions of both representations are formally specified, the proof of correspondence between those portions of the representations shall be formal.**

D R A F T

Evaluator action elements:

ADV_RCR.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_RCR.3.2E **The evaluator shall determine the accuracy of the proofs of correspondence by selectively verifying the formal analysis.**

D R A F T

ADV_SPM Security policy modeling

Objectives

323 It is the objective of this family to provide additional assurance that the security functions in the functional specification enforce the policies in the TSP. This is accomplished via the development of a security policy model which is based on a subset of the policies of the TSP, and establishing a correspondence between the functional specification, the security policy model, and these policies of the TSP.

Component levelling

324 The components in this family are levelled on the basis of the degree of formality required of the TSP model, and the degree of formality required of the correspondence between the TSP model and the functional specification.

Application notes

325 While a TSP may include any policies, TSP models have traditionally represented only subsets of those policies, because modeling certain policies is currently beyond the state of the art. The current state of the art determines which policies can be modeled, and the PP/ST author should identify specific functions and associated policies that can, and thus are required to be, modeled. At the very least, access control and information flow control policies are required to be modeled since they are currently within the state of the art.

326 For each of the components within this family, there is a requirement to describe the rules and characteristics of applicable policies of the TSP in the TSP model and to ensure that the TSP model satisfies the corresponding policies of the TSP. The “rules” and “characteristics” of a TSP model are intended to allow flexibility in the type of model that may be developed (e.g. state transition, non-interference). For example, rules may be represented as “properties” (e.g. simple security property) and characteristics may be represented as definitions such as “initial state”, “secure state”, “subjects” and “objects”.

ADV_SPM.1 Informal TOE security policy model

Dependencies:

ADV_FSP.1 Informal functional specification

Developer action elements:

ADV_SPM.1.1D **The developer shall provide a TSP model.**

ADV_SPM.1.2D **The developer shall demonstrate correspondence between the functional specification and the TSP model.**

D R A F T

Content and presentation of evidence elements:

ADV_SPM.1.1C **The TSP model shall be informal.**

ADV_SPM.1.2C **The TSP model shall describe the rules and characteristics of all policies of the TSP that can be modeled.**

ADV_SPM.1.3C **The TSP model shall include a rationale that demonstrates that it is consistent and complete with respect to all policies of the TSP that can be modeled.**

ADV_SPM.1.4C **The demonstration of correspondence between the TSP model and the functional specification shall show that all of the security functions in the functional specification are consistent and complete with respect to the TSP model.**

ADV_SPM.1.5C **The demonstration of correspondence between the TSP model and the functional specification may be informal.**

Evaluator action elements:

ADV_SPM.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ADV_SPM.2 Semiformal TOE security policy model

Dependencies:

ADV_FSP.1 Informal functional specification

Developer action elements:

ADV_SPM.2.1D The developer shall provide a TSP model.

ADV_SPM.2.2D The developer shall demonstrate correspondence between the functional specification and the TSP model.

Content and presentation of evidence elements:

ADV_SPM.2.1C The TSP model shall be **semiformal**.

ADV_SPM.2.2C The TSP model shall describe the rules and characteristics of all policies of the TSP that can be modeled.

ADV_SPM.2.3C The TSP model shall include a rationale that demonstrates that it is consistent and complete with respect to all policies of the TSP that can be modeled.

ADV_SPM.2.4C The demonstration of correspondence between the TSP model and the functional specification shall show that all of the security functions in the functional specification are consistent and complete with respect to the TSP model.

D R A F T

ADV_SPM.2.5C **Where the functional specification is informal,** the demonstration of correspondence between the TSP model and the functional specification may be informal.

ADV_SPM.2.6C **Where the functional specification is at least semiformal, the demonstration of correspondence between the TSP model and the functional specification shall be semiformal.**

Evaluator action elements:

ADV_SPM.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ADV_SPM.3 Formal TOE security policy model

Dependencies:

ADV_FSP.1 Informal functional specification

Developer action elements:

ADV_SPM.3.1D The developer shall provide a TSP model.

ADV_SPM.3.2D The developer shall demonstrate **or prove** correspondence between the functional specification and the TSP model.

Content and presentation of evidence elements:

ADV_SPM.3.1C The TSP model shall be **formal**.

ADV_SPM.3.2C The TSP model shall describe the rules and characteristics of all policies of the TSP that can be modeled.

ADV_SPM.3.3C The TSP model shall include a rationale that demonstrates that it is consistent and complete with respect to all policies of the TSP that can be modeled.

ADV_SPM.3.4C The demonstration of correspondence between the TSP model and the functional specification shall show that all of the security functions in the functional specification are consistent and complete with respect to the TSP model.

ADV_SPM.3.5C Where the functional specification is informal, the demonstration of correspondence between the TSP model and the functional specification may be informal.

ADV_SPM.3.6C Where the functional specification is **semiformal**, the demonstration of correspondence between the TSP model and the functional specification shall be semiformal.

ADV_SPM.3.7C **Where the functional specification is formal, the proof of correspondence between the TSP model and the functional specification shall be formal.**

Evaluator action elements:

ADV_SPM.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

Class AGD

Guidance documents

327 The guidance documents class provides the requirements for user and administrator guidance documentation. For the secure administration and use of the TOE it is necessary to describe all relevant aspects for the secure application of the TOE.

328 Figure 5.5 shows the families within this class, and the hierarchy of components within the families.

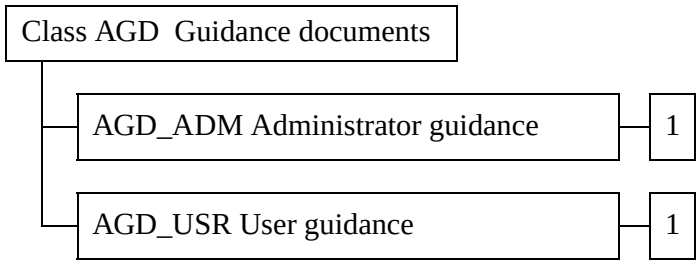

Figure 5.5 - Guidance documents class decomposition

AGD_ADM Administrator guidance

Objectives

329 Administrator guidance refers to written material that is intended to be used by those persons responsible for configuring, maintaining, and administering the TOE in a correct manner for maximum security. Because the secure operation of the TOE is dependent upon the correct performance of the TSF, persons responsible for performing these functions are trusted by the TSF. Administrator guidance is intended to help administrators understand the security functions provided by the TOE, including both those functions that require the administrator to perform security-critical actions and those functions that provide security-critical information.

Component levelling

330 This family contains only one component.

Application notes

331 The requirements AGD_ADM.1.3C and AGD_ADM.1.5C encompass the aspect that any warnings to the users of a TOE with regard to the TOE security environment and the security objectives described in the PP/ST are appropriately covered in the administrator guidance.

332 The concept of safe values, as employed in AGD_ADM.1.4C, has relevance where an administrator has control over security parameters. Guidance needs to be provided on safe and unsafe settings for such parameters. This concept is related to the use of the Part 2 component FMT_MSA.2.

AGD_ADM.1 Administrator guidance

Dependencies:

ADV_FSP.1 Informal functional specification

Developer action elements:

AGD_ADM.1.1D **The developer shall provide administrator guidance addressed to system administrative personnel.**

Content and presentation of evidence elements:

AGD_ADM.1.1C **The administrator guidance shall describe the administrative functions and interfaces available to the administrator of the TOE.**

AGD_ADM.1.2C **The administrator guidance shall describe how to administer the TOE in a secure manner.**

AGD_ADM.1.3C **The administrator guidance shall contain warnings about functions and privileges that should be controlled in a secure processing environment.**

AGD_ADM.1.4C **The administrator guidance shall describe all security parameters under the control of the administrator indicating safe values as appropriate.**

AGD_ADM.1.5C **The administrator guidance shall describe each type of security-relevant event relative to the administrative functions that need to be performed, including changing the security characteristics of entities under the control of the TSF.**

AGD_ADM.1.6C **The administrator guidance shall be consistent with all other documents supplied for evaluation.**

AGD_ADM.1.7C **The administrator guidance shall describe all security requirements on the IT environment which are relevant to the administrator.**

Evaluator action elements:

AGD_ADM.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

AGD_USR User guidance

Objectives

333 User guidance refers to material that is intended to be used by non-administrative human users of the TOE, and by others (e.g. programmers) using the TOE's external interfaces. User guidance describes the security functions provided by the TSF and provides instructions and guidelines, including warnings, for its secure use.

334 The user guidance provides a basis for assumptions about the use of the TOE and a measure of confidence that non-malicious users, application providers and others exercising the external interfaces of the TOE will understand the secure operation of the TOE and will use it as intended.

Component levelling

335 This family contains only one component.

Application notes

336 The requirement AGD_USR.1.3.C and AGD_USR.1.5C encompass the aspect that any warnings to the users of a TOE with regard to the TOE security environment and the security objectives described in the PP/ST are appropriately covered in the user guidance.

337 In many cases it may be appropriate that guidance is provided in separate documents: one for human users, and one for application programmers and/or hardware designers using software or hardware interfaces.

AGD_USR.1 User guidance

Dependencies:

ADV_FSP.1 Informal functional specification

Developer action elements:

AGD_USR.1.1D **The developer shall provide user guidance.**

Content and presentation of evidence elements:

AGD_USR.1.1C **The user guidance shall describe the functions and interfaces available to the non-administrative users of the TOE.**

AGD_USR.1.2C **The user guidance shall describe the use of user-accessible security functions provided by the TOE.**

AGD_USR.1.3C **The user guidance shall contain warnings about user-accessible functions and privileges that should be controlled in a secure processing environment.**

AGD_USR.1.4C **The user guidance shall clearly present all user responsibilities necessary for secure operation of the TOE, including all assumptions about user behaviour found in the statement of TOE security environment.**

AGD_USR.1.5C **The user guidance shall be consistent with all other documentation supplied for evaluation.**

AGD_USR.1.6C **The user guidance shall describe all security requirements on the IT environment which are relevant to the user.**

Evaluator action elements:

AGD_USR.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

Class ALC

Life cycle support

338 Life-cycle support is an aspect of establishing discipline and control in the processes of refinement of the TOE during development and maintenance. Confidence in the correspondence between the TOE security requirements and the TOE is greater if security analysis and the production of the evidence are done on a regular basis as an integral part of the development and maintenance activities.

339 Figure 5.6 shows the families within this class, and the hierarchy of components within the families.

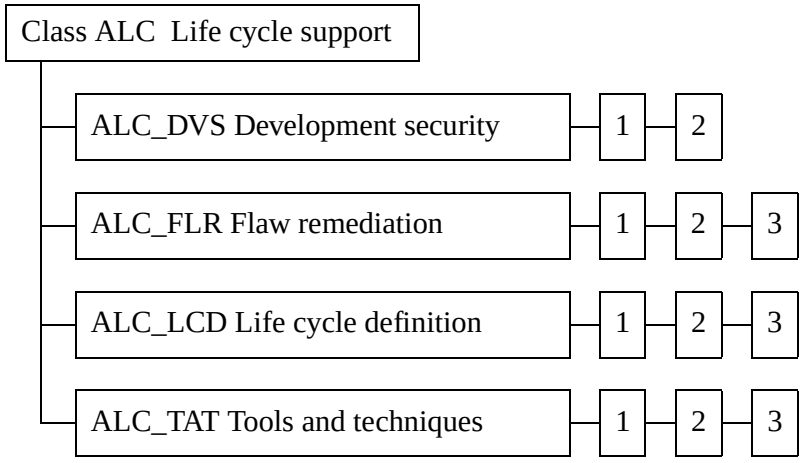

Figure 5.6 -Life-cycle support class decomposition

ALC_DVS Development security

Objectives

340 Development security is concerned with physical, procedural, personnel, and other security measures that may be used in the development environment to protect the TOE. It includes the physical security of the development location and any procedures used to select development staff.

Component levelling

341 The components in this family are levelled on the basis of whether justification of the sufficiency of the security measures is required.

Application notes

342 This family deals with measures to remove or reduce threats existing at the developer's site. Conversely, threats to be countered at the TOE user's site are normally covered in the security environment section of a PP or ST.

343 The evaluator should determine whether there is a need for visiting the developer's site in order to confirm that the requirements of this family are met.

344 It is recognised that confidentiality may not always be an issue for the protection of the TOE in its development environment. The use of the word "necessary" allows for the selection of appropriate safeguards.

ALC_DVS.1 Identification of security measures

Dependencies:

No dependencies.

Developer action elements:

ALC_DVS.1.1D **The developer shall produce development security documentation.**

Content and presentation of evidence elements:

ALC_DVS.1.1C **The development security documentation shall describe the physical, procedural, personnel, and other security measures that are necessary to protect the confidentiality and integrity of the TOE design and implementation in its development environment.**

ALC_DVS.1.2C **The development security documentation shall provide evidence that these security measures are followed during the development and maintenance of the TOE.**

Evaluator action elements:

ALC_DVS.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ALC_DVS.1.2E **The evaluator shall check whether the security measures are being applied.**

ALC_DVS.2 Sufficiency of security measures

Dependencies:

No dependencies.

Developer action elements:

ALC_DVS.2.1D The developer shall produce development security documentation.

Content and presentation of evidence elements:

ALC_DVS.2.1C The development security documentation shall describe the physical, procedural, personnel, and other security measures that are necessary to protect the confidentiality and integrity of the TOE design and implementation in its development environment.

ALC_DVS.2.2C The development security documentation shall provide evidence that these security measures are followed during the development and maintenance of the TOE.

ALC_DVS.2.3C **The evidence shall justify that the security measures are sufficient to protect the confidentiality and integrity of the TOE.**

Evaluator action elements:

ALC_DVS.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ALC_DVS.2.2E The evaluator shall check whether the security measures are being applied.

ALC_FLR Flaw remediation

Objectives

345 Flaw remediation requires that discovered flaws be tracked and corrected by the developer. Although future compliance with flaw remediation procedures cannot be determined at the time of the TOE evaluation, it is possible to evaluate the policies and procedures that a developer has in place to track and correct flaws, and to distribute the flaw information and corrections.

Component levelling

346 The components in this family are levelled on the basis of the increasing extent in scope of the flaw remediation procedures and the rigour of the flaw remediation policies.

Application notes

347 The PP/ST author should consider whether it would be useful to introduce the assurance provided by a flaw remediation component into the PP/ST. This should receive special attention as no flaw remediation component is included in any EAL and the absence of such components decreases the assurance that the TOE received will be well-maintained and supported in the future. Specifically, security flaws may not be properly corrected and corrections may not be distributed. In considering which flaw remediation component to select, the selected EAL and intended application of the TOE should be primary factors. In general, higher FLR components are more appropriate for the higher EALs and for very sensitive applications.

ALC_FLR.1 Basic flaw remediation

Dependencies:

No dependencies.

Developer action elements:

ALC_FLR.1.1D **The developer shall document the flaw remediation procedures.**

Content and presentation of evidence elements:

ALC_FLR.1.1C **The flaw remediation procedures documentation shall describe the procedures used to track all reported security flaws in each release of the TOE.**

ALC_FLR.1.2C **The flaw remediation procedures shall require that a description of the nature and effect of each security flaw be provided, as well as the status of finding a correction to that flaw.**

ALC_FLR.1.3C **The flaw remediation procedures shall require that corrective actions be identified for each of the security flaws.**

ALC_FLR.1.4C **The flaw remediation procedures documentation shall describe the methods used to provide flaw information, corrections and guidance on corrective actions to TOE users.**

Evaluator action elements:

ALC_FLR.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ALC_FLR.2 Flaw reporting procedures

Dependencies:

No dependencies.

Developer action elements:

ALC_FLR.2.1D The developer shall document the flaw remediation procedures.

ALC_FLR.2.2D **The developer shall establish a procedure for accepting and acting upon user reports of security flaws and requests for corrections to those flaws.**

Content and presentation of evidence elements:

ALC_FLR.2.1C The flaw remediation procedures documentation shall describe the procedures used to track all reported security flaws in each release of the TOE.

ALC_FLR.2.2C The flaw remediation procedures shall require that a description of the nature and effect of each security flaw be provided, as well as the status of finding a correction to that flaw.

ALC_FLR.2.3C The flaw remediation procedures shall require that corrective actions be identified for each of the security flaws.

ALC_FLR.2.4C The flaw remediation procedures documentation shall describe the methods used to provide flaw information, corrections and guidance on corrective actions to TOE users.

ALC_FLR.2.5C **The procedures for processing reported security flaws shall ensure that any reported flaws are corrected and the correction issued to TOE users.**

ALC_FLR.2.6C **The procedures for processing reported security flaws shall provide safeguards that any corrections to these security flaws do not introduce any new flaws.**

Evaluator action elements:

ALC_FLR.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ALC_FLR.3 Systematic flaw remediation

Dependencies:

No dependencies.

Developer action elements:

ALC_FLR.3.1D The developer shall document the flaw remediation procedures.

ALC_FLR.3.2D The developer shall establish a procedure for accepting and acting upon user reports of security flaws and requests for corrections to those flaws.

ALC_FLR.3.3D **The developer shall designate one or more specific points of contact for user reports and inquiries about security issues involving the TOE.**

Content and presentation of evidence elements:

ALC_FLR.3.1C The flaw remediation procedures documentation shall describe the procedures used to track all reported security flaws in each release of the TOE.

ALC_FLR.3.2C The flaw remediation procedures shall require that a description of the nature and effect of each security flaw be provided, as well as the status of finding a correction to that flaw.

ALC_FLR.3.3C The flaw remediation procedures shall require that corrective actions be identified for each of the security flaws.

ALC_FLR.3.4C The flaw remediation procedures documentation shall describe the methods used to provide flaw information, corrections and guidance on corrective actions to TOE users.

ALC_FLR.3.5C The procedures for processing reported security flaws shall ensure that any reported flaws are corrected and the correction issued to TOE users.

ALC_FLR.3.6C The procedures for processing reported security flaws shall provide safeguards that any corrections to these security flaws do not introduce any new flaws.

ALC_FLR.3.7C **The flaw remediation procedures shall include a procedure requiring timely responses for the automatic distribution of security flaw reports and the associated corrections to registered users who might be affected by the security flaw.**

Evaluator action elements:

ALC_FLR.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ALC_LCD Life cycle definition

Objectives

348 Poorly controlled development and maintenance can result in a flawed implementation of a TOE (or a TOE that does not meet all of its security requirements). This, in turn, results in security violations. Therefore, it is important that a model for the development and maintenance of a TOE be established as early as possible in the TOE's life-cycle.

349 Using a model for the development and maintenance of a TOE does not guarantee that the TOE will be free of flaws, nor does it guarantee that the TOE will meet all of its security functional requirements. It is possible that the model chosen will be insufficient or inadequate and therefore no benefits in the quality of the TOE could be observed. Using a life-cycle model that has been approved by some group of experts (e.g. academic experts, standards bodies) improves the chances that the development and maintenance models will contribute to the overall quality of the TOE.

Component levelling

350 The components in this family are levelled on the basis of increasing requirements for standardisation and measurability of the life-cycle model, and for compliance with that model.

Application notes

351 A life-cycle model encompasses the procedures, tools and techniques used to develop and maintain the TOE. Aspects of the process which may be covered by such a model include design methods, review procedures, project management controls, change control procedures, test methods and acceptance procedures. An effective life-cycle model will address these aspects of the development and maintenance process within an overall management structure which assigns responsibilities and monitors progress.

352 Although life-cycle definition deals with the maintenance of the TOE and hence with aspects becoming relevant after the completion of the evaluation, its evaluation adds assurance through an analysis of the life-cycle information for the TOE provided at the time of the evaluation.

353 A standardised life-cycle model is a model that has been approved by some group of experts (e.g. academic experts, standards bodies).

354 A measurable life-cycle model is a model with arithmetic parameters and/or metrics that measure TOE development properties (e.g. source code complexity metrics).

355 A life-cycle model provides for the necessary control over the development and maintenance of the TOE, if the developer can supply information which shows that the model appropriately minimises the danger of security violations in the TOE.

Information given in the ST about the intended environment of the TOE and about the TOE's security objectives should be used for that information.

ALC_LCD.1 Developer defined life-cycle model

Dependencies:

No dependencies.

Developer action elements:

ALC_LCD.1.1D **The developer shall establish a life-cycle model to be used in the development and maintenance of the TOE.**

ALC_LCD.1.2D **The developer shall provide life-cycle definition documentation.**

Content and presentation of evidence elements:

ALC_LCD.1.1C **The life-cycle definition documentation shall describe the model used to develop and maintain the TOE.**

ALC_LCD.1.2C **The life-cycle model shall provide for the necessary control over the development and maintenance of the TOE.**

Evaluator action elements:

ALC_LCD.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ALC_LCD.2 Standardised life-cycle model

Dependencies:

No dependencies.

Developer action elements:

ALC_LCD.2.1D The developer shall establish a life-cycle model to be used in the development and maintenance of the TOE.

ALC_LCD.2.2D The developer shall provide life-cycle definition documentation.

ALC_LCD.2.3D **The developer shall use a standardised life-cycle model to develop and maintain the TOE.**

Content and presentation of evidence elements:

ALC_LCD.2.1C The life-cycle definition documentation shall describe the model used to develop and maintain the TOE.

ALC_LCD.2.2D The life-cycle model shall provide for the necessary control over the development and maintenance of the TOE.

ALC_LCD.2.3C **The life-cycle definition documentation shall explain why the model was chosen and how it is used to develop and maintain the TOE.**

ALC_LCD.2.4C **The life-cycle definition documentation shall demonstrate compliance with the standardised life-cycle model.**

Evaluator action elements:

ALC_LCD.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ALC_LCD.3 Measurable life-cycle model

Dependencies:

No dependencies.

Developer action elements:

ALC_LCD.3.1D The developer shall establish a life-cycle model to be used in the development and maintenance of the TOE.

ALC_LCD.3.2D The developer shall provide life-cycle definition documentation.

ALC_LCD.3.3D The developer shall use a standardised **and measurable** life-cycle model to develop and maintain the TOE.

ALC_LCD.3.4D **The developer shall measure the TOE development using the standardised and measurable life-cycle model.**

Content and presentation of evidence elements:

ALC_LCD.3.1C The life-cycle definition documentation shall describe the model used to develop and maintain the TOE.

ALC_LCD.3.2D The life-cycle model shall provide for the necessary control over the development and maintenance of the TOE.

ALC_LCD.3.3C The life-cycle definition documentation shall explain why the model was chosen and how it is used to develop and maintain the TOE.

ALC_LCD.3.4C The life-cycle definition documentation shall demonstrate compliance with the standardised **and measurable** life-cycle model.

ALC_LCD.3.5C **The life-cycle documentation shall provide the results of the measurements of the TOE development using the standardised and measurable life-cycle model.**

Evaluator action elements:

ALC_LCD.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ALC_TAT Tools and techniques

Objectives

356 Tools and techniques is an aspect of selecting tools which are used to develop, analyse and implement the TOE. It includes requirements to prevent ill-defined, inconsistent or incorrect development tools from being used to develop the TOE. This includes, but is not limited to programming languages, documentation, implementation standards, and other parts of the TOE like supporting runtime libraries.

Component levelling

357 The components in this family are levelled on the basis of increasing requirements on the description and scope of the implementation standards and the documentation of implementation dependent options.

Application notes

358 There is a requirement for well-defined development tools. These are tools which have been shown to be well understood and applicable without the need for intensive further clarification. For example, programming languages and computer aided design (CAD) systems that are based on an a standard published by standards bodies are considered to be well-defined.

359 Tools and techniques distinguishes between the implementation standards applied by the developer and the implementation standards for “all parts of the TOE” which additionally includes third party software, hardware, or firmware.

360 The requirement in ALC_TAT.1.2C is specifically applicable to programming languages so as to ensure that all statements in the source code have an unambiguous meaning.

ALC_TAT.1 Well defined development tools

Dependencies:

ADV_IMP.1 Subset of the implementation of the TSF

Developer action elements:

ALC_TAT.1.1D **The developer shall identify the development tools being used for the TOE.**

ALC_TAT.1.2D **The developer shall document the selected implementation dependent options of the development tools.**

Content and presentation of evidence elements:

ALC_TAT.1.1C **All development tools used for implementation shall be well-defined.**

ALC_TAT.1.2C **The documentation of the development tools shall unambiguously define the meaning of all statements used in the implementation.**

ALC_TAT.1.3C **The documentation of the development tools shall unambiguously define the meaning of all implementation dependent options.**

Evaluator action elements:

ALC_TAT.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ALC_TAT.2 Compliance with implementation standards

Dependencies:

ADV_IMP.1 Subset of the implementation of the TSF

Developer action elements:

ALC_TAT.2.1D The developer shall identify the development tools being used for the TOE.

ALC_TAT.2.2D The developer shall document the selected implementation dependent options of the development tools.

ALC_TAT.2.3D **The developer shall describe the implementation standards to be applied.**

Content and presentation of evidence elements:

ALC_TAT.2.1C All development tools used for implementation shall be well-defined.

ALC_TAT.2.2C The documentation of the development tools shall unambiguously define the meaning of all statements used in the implementation.

ALC_TAT.2.3C The documentation of the development tools shall unambiguously define the meaning of all implementation dependent options.

Evaluator action elements:

ALC_TAT.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ALC_TAT.2.2E **The evaluator shall confirm that the implementation standards have been applied.**

ALC_TAT.3 Compliance with implementation standards - all parts

Dependencies:

ADV_IMP.1 Subset of the implementation of the TSF

Developer action elements:

ALC_TAT.3.1D The developer shall identify the development tools being used for the TOE.

ALC_TAT.3.2D The developer shall document the selected implementation dependent options of the development tools.

ALC_TAT.3.3D The developer shall describe the implementation standards **for all parts of the TOE**.

Content and presentation of evidence elements:

ALC_TAT.3.1C All development tools used for implementation shall be well-defined.

ALC_TAT.3.2C The documentation of the development tools shall unambiguously define the meaning of all statements used in the implementation.

ALC_TAT.3.3C The documentation of the development tools shall unambiguously define the meaning of all implementation dependent options.

Evaluator action elements:

ALC_TAT.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ALC_TAT.3.2E The evaluator shall confirm that the implementation standards have been applied.

D R A F T

Class ATE

Tests

361 The class “Tests” encompasses four families: coverage (ATE_COV), depth (ATE_DPT), independent testing (e.g. functional testing performed by evaluators) (ATE_IND), and functional tests (ATE_FUN). Testing helps to establish that the TOE security functional requirements are met. Testing provides assurance that the TOE satisfies at least the TOE security functional requirements, although it cannot establish that the TOE does no more than what was specified. Testing may also be directed toward the internal structure of the TSF, such as the testing of subsystems and modules against their specifications.

362 The aspects of coverage and depth have been separated from functional tests for reasons of increased flexibility in applying the components of the families. However, the requirements in these three families are intended to be applied together.

363 The independent testing family has dependencies on the other families to provide the necessary information to support the requirements, but is primarily concerned with independent evaluator actions.

364 The emphasis in this class is on confirmation that the TSF operates according to its specification. This will include both positive testing based on functional requirements, and negative testing to check that undesirable behaviour is absent. This class does not address penetration testing, which is directed toward finding vulnerabilities that enable a user to violate the security policy. Penetration testing is based upon an analysis of the TOE which specifically seeks to identify vulnerabilities in the design and implementation of the TSF, and is addressed separately as an aspect of vulnerability assessment in the class AVA.

D R A F T

365 Figure 5.7 shows the families within this class, and the hierarchy of components within the families.

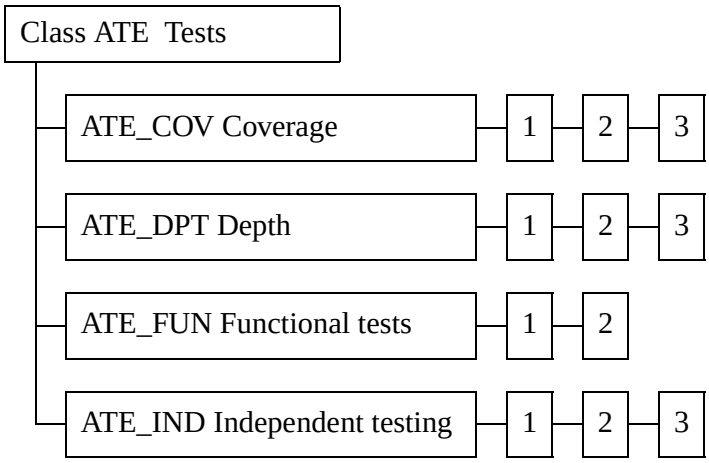

Figure 5.7 -Tests class decomposition

D R A F T

ATE_COV Coverage

Objectives

366 This family addresses those aspects of testing that deal with completeness of test coverage. That is, it addresses the extent to which the TSF is tested, and whether or not the testing is sufficiently extensive to demonstrate that the TSF operates as specified.

Component levelling

367 The components in this family are levelled on the basis of increasing rigour of interface testing, and increasing rigour of the analysis of the sufficiency of the tests to demonstrate that the TSF operates in accordance with its functional specification.

Application notes

368 The specific documentation required by the coverage components will be determined, in most cases, by the documentation stipulated in the level of ATE_FUN that is specified.

ATE_COV.1 Evidence of coverage

Objectives

369 In this component, the objective is to establish that the TSF has been tested against its functional specification. This is to be achieved through an examination of developer evidence of correspondence.

Application notes

370 While the testing objective is to cover the TSF, there is no more than informal evidence to support this assertion.

Dependencies:

ADV_FSP.1 Informal functional specification

ATE_FUN.1 Functional testing

Developer action elements:

ATE_COV.1.1D **The developer shall provide evidence of the test coverage.**

Content and presentation of evidence elements:

ATE_COV.1.1C **The evidence of the test coverage shall show the correspondence between the tests identified in the test documentation and the TSF as described in the functional specification.**

Evaluator action elements:

ATE_COV.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ATE_COV.2 Analysis of coverage

Objectives

371 In this component, the objective is to establish that the TSF has been tested against its functional specification in a systematic manner. This is to be achieved through an examination of developer analysis of correspondence.

Application notes

372 The evidence of the test coverage in support of the detailed correspondence can be informal.

Dependencies:

ADV_FSP.1 Informal functional specification

ATE_FUN.1 Functional testing

Developer action elements:

ATE_COV.2.1D The developer shall provide **an analysis** of the test coverage.

Content and presentation of evidence elements:

ATE_COV.2.1C The **analysis** of the test coverage shall **demonstrate** the correspondence between the tests identified in the test documentation and the TSF as described in the functional specification.

ATE_COV.2.2C **The analysis of the test coverage shall demonstrate that the correspondence between the TSF as described in the functional specification and the tests identified in the test documentation is complete.**

Evaluator action elements:

ATE_COV.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ATE_COV.3 Rigorous analysis of coverage

Objectives

373 In this component, the objective is to establish that the TSF has been tested against its functional specification in a systematic and exhaustive manner. This is to be achieved through an examination of developer analysis of correspondence.

Application notes

374 This component requires a convincing argument on the part of the developer that the tests completely cover the TSF. There will remain little scope for devising additional tests, as the interface will have been exhaustively tested.

Dependencies:

ADV_FSP.1 Informal functional specification

ATE_FUN.1 Functional testing

Developer action elements:

ATE_COV.3.1D The developer shall provide an analysis of the test coverage.

Content and presentation of evidence elements:

ATE_COV.3.1C The analysis of the test coverage shall show the correspondence between the tests identified in the test documentation and the TSF as described in the functional specification.

ATE_COV.3.2C The analysis of the test coverage shall demonstrate that the correspondence between the TSF as described in the functional specification and the tests identified in the test documentation is complete.

ATE_COV.3.3C **The analysis of the test coverage shall rigorously demonstrate that all external interfaces of the TSF identified in the functional specification have been completely tested.**

Evaluator action elements:

ATE_COV.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

D R A F T

ATE_DPT Depth

Objectives

375 The components in this family deal with the level of detail to which the TSF is tested. Testing of security functions is based upon increasing depth of information derived from analysis of the representations.

376 The objective is to counter the risk of missing an error in the development of the TOE. Additionally, the components of this family, especially as testing is more concerned with the internal structure of the TSF, are more likely to discover any malicious code that has been inserted.

377 Testing which exercises specific internal interfaces can provide assurance not only that the TSF exhibits the desired external security behaviour, but also that this behaviour stems from correctly operating internal mechanisms.

Component levelling

378 The components in this family are levelled on the increasing level of detail provided in the TSF representations, from the high-level design to the implementation representation. This levelling reflects the representations presented in the ADV class.

Application notes

379 The specific amount and type of documentation and evidence will, in general, be determined by that required by the level of ATE_FUN selected.

380 Testing at the level of the functional specification is addressed by ATE_COV.

381 The principle adopted within this family is that the level of testing be appropriate to the level of assurance that is being sought. Where higher components are applied the test results will need to demonstrate that the implementation of the TSF is consistent with its design. For example, the HLD should describe each of the subsystems and also describe the interfaces between these subsystems in sufficient detail. Evidence of testing must show that the internal interfaces between subsystems have been exercised. This may be achieved through testing via the external interfaces of the TSF, or by testing of the subsystem interfaces in isolation, perhaps employing a test harness. In cases where some aspects of an internal interface cannot be tested via the external interfaces, then there should either be justification that these aspects do not need to be tested, or the internal interface needs to be tested directly, in which case the HLD needs to be sufficiently detailed in order to facilitate direct testing. The higher components in this family aim to check the correct operation of internal interfaces that become visible as the design becomes less abstract. When these components are applied it will be more difficult to provide adequate evidence of the depth of testing using the TSF's external interfaces alone, and modular testing will usually be necessary.

D R A F T

ATE_DPT.1 Testing - high level design

Objectives

382 The subsystems of a TSF provide a high level description of the internal workings of the TSF. Testing at the level of the subsystems, in order to demonstrate the presence of any flaws, provides assurance that the TSF subsystems have been correctly realised.

Application notes

383 The developer is expected to describe the testing of the high level design of the TSF in terms of “subsystems”. The term “subsystem” is used to express the notion of decomposing the TSF into a relatively small number of parts.

Dependencies:

ADV_HLD.1 Descriptive high-level design

ATE_FUN.1 Functional testing

Developer action elements:

ATE_DPT.1.1D **The developer shall provide the analysis of the depth of testing.**

Content and presentation of evidence elements:

ATE_DPT.1.1C **The depth analysis shall demonstrate that the tests identified in the test documentation are sufficient to demonstrate that the TSF operates in accordance with the its high level design.**

Evaluator action elements:

ATE_DPT.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ATE_DPT.2 Testing - low level design

Objectives

384 The subsystems of a TSF provide a high level description of the internal workings of the TSF. Testing at the level of the subsystems, in order to demonstrate the presence of any flaws, provides assurance that the TSF subsystems have been correctly realised.

385 The modules of a TSF provide a description of the internal workings of the TSF. Testing at the level of the modules, in order to demonstrate the presence of any flaws, provides assurance that the TSF modules have been correctly realised.

D R A F T

Application notes

386 The developer is expected to describe the testing of the high level design of the TSF in terms of “subsystems”. The term “subsystem” is used to express the notion of decomposing the TSF into a relatively small number of parts.

387 The developer is expected to describe the testing of the low level design of the TSF in terms of “modules”. The term “modules” is used to express the notion of decomposing each of the “subsystems” of the TSF into a relatively small number of parts.

Dependencies:

ADV_HLD.2 Security enforcing high-level design

ADV_LLD.1 Descriptive low-level design

ATE_FUN.1 Functional testing

Developer action elements:

ATE_DPT.2.1D The developer shall provide the analysis of the depth of testing.

Content and presentation of evidence elements:

ATE_DPT.2.1C The depth analysis shall demonstrate that the tests identified in the test documentation are sufficient to demonstrate that the TSF operates in accordance with the its high-level design **and low-level design**.

Evaluator action elements:

ATE_DPT.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ATE_DPT.3 Testing - implementation

Objectives

388 The subsystems of a TSF provide a high level description of the internal workings of the TSF. Testing at the level of the subsystems, in order to demonstrate the presence of any flaws, provides assurance that the TSF subsystems have been correctly realised.

389 The modules of a TSF provide a description of the internal workings of the TSF. Testing at the level of the modules, in order to demonstrate the presence of any flaws, provides assurance that the TSF modules have been correctly realised.

390 The implementation representation of a TSF provides a detailed description of the internal workings of the TSF. Testing at the level of the implementation, in order to demonstrate the presence of any flaws, provides assurance that the TSF implementation has been correctly realised.

Application notes

391 The developer is expected to describe the testing of the high level design of the TSF in terms of “subsystems”. The term “subsystem” is used to express the notion of decomposing the TSF into a relatively small number of parts.

392 The developer is expected to describe the testing of the low level design of the TSF in terms of “modules”. The term “modules” is used to express the notion of decomposing each of the “subsystems” of the TSF into a relatively small number of parts.

393 The implementation representation is the one which is used to generate the TSF itself (e.g. source code which is then compiled).

Dependencies:

ADV_HLD.2 Security enforcing high-level design

ADV_IMP.2 Implementation of the TSF

ADV_LLD.1 Descriptive low-level design

ATE_FUN.1 Functional testing

Developer action elements:

ATE_DPT.3.1D The developer shall provide the analysis of the depth of testing.

Content and presentation of evidence elements:

ATE_DPT.3.1C The depth analysis shall demonstrate that the tests identified in the test documentation are sufficient to demonstrate that the TSF operates in accordance with its high-level design, low-level design **and implementation representation**.

Evaluator action elements:

ATE_DPT.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

D R A F T

ATE_FUN Functional tests

Objectives

394 Functional testing performed by the developer establishes that the TSF exhibits the properties necessary to satisfy the functional requirements of its PP/ST. Such functional testing provides assurance that the TSF satisfies at least the security functional requirements, although it cannot establish that the TSF does no more than what was specified. The family “Functional tests” is focused on the type and amount of documentation or support tools required, and what is to be demonstrated through developer testing. Functional testing is not limited to positive confirmation that the required security functions are provided, but may also include negative testing to check for the absence of particular undesired behaviour (often based on the inversion of functional requirements).

395 This family contributes to providing assurance that the likelihood of undiscovered flaws is relatively small.

396 The families ATE_COV, ATE_DPT and ATE_FUN are used in combination to define the evidence of testing to be supplied by a developer. Independent functional testing by the evaluator is specified by ATE_IND.

397 This family contains two components, the higher requiring that ordering dependencies are analysed.

Application notes

398 Procedures for performing tests are expected to provide instructions for using test programs and test suites, including the test environment, test conditions, test data parameters and values. The test procedures should also show how the test results is derived from the test inputs.

399 This family specifies requirements for the presentation of all test plans, procedures and results. Thus the quantity of information which must be presented will vary in accordance with the use of ATE_COV and ATE.DPT.

ATE_FUN.1 Functional testing

Objectives

400 The objective is for the developer to demonstrate that all security functions perform as specified. The developer is required to perform testing and to provide test documentation.

Dependencies:

ATE_COV.1 Evidence of coverage

Developer action elements:

ATE_FUN.1.1D **The developer shall test the TSF and document the results.**

ATE_FUN.1.2D **The developer shall provide test documentation.**

Content and presentation of evidence elements:

ATE_FUN.1.1C **The test documentation shall consist of test plans, test procedure descriptions, expected test results and actual test results.**

ATE_FUN.1.2C **The test plans shall identify the security functions to be tested and describe the goal of the tests to be performed.**

ATE_FUN.1.3C **The test procedure descriptions shall identify the tests to be performed and describe the scenarios for testing each security function. These scenarios shall include any ordering dependencies on the results of other tests.**

ATE_FUN.1.4C **The expected test results shall show the anticipated outputs from a successful execution of the tests.**

ATE_FUN.1.5C **The test results from the developer execution of the tests shall demonstrate that each security function operates as specified.**

Evaluator action elements:

ATE_FUN.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ATE_FUN.2 Ordered functional testing

Objectives

401 The objective is for the developer to demonstrate that all security functions perform as specified. The developer is required to perform testing and to provide test documentation.

402 In this component, an additional objective is to ensure that testing is structured such as to avoid circular arguments about the correctness of the portions of the TSF being tested.

Application notes

403 Ordering dependencies between tests can be of different forms. For example, test A provides a result to test B; test A cannot run before test B, since it breaks something required by test B; test failure in test B might be because of a failure in “untested” test A.

404 Although the test procedures may state pre-requisite initial test conditions in terms of ordering of tests, they may not provide a rationale for the ordering. An analysis

of test ordering is an important factor in determining the adequacy of testing, as there is a possibility of faults being concealed by the ordering of tests.

Dependencies:

ATE_COV.1 Evidence of coverage

Developer action elements:

ATE_FUN.2.1D The developer shall test the TSF and document the results.

ATE_FUN.2.2D The developer shall provide test documentation.

Content and presentation of evidence elements:

ATE_FUN.2.1C The test documentation shall consist of test plans, test procedure descriptions, expected test results and test results.

ATE_FUN.2.2C The test plans shall identify the security functions to be tested and describe the goal of the tests to be performed.

ATE_FUN.2.3C The test procedure descriptions shall identify the tests to be performed and describe the scenarios for testing each security function. These scenarios shall include any ordering dependencies on the results of other tests.

ATE_FUN.2.4C The expected test results shall show the anticipated outputs from a successful execution of the tests.

ATE_FUN.2.5C The test results from the developer execution of the tests shall demonstrate that each security function operates as specified.

ATE_FUN.2.6C **The test documentation shall include an analysis of the test procedure ordering dependencies.**

Evaluator action elements:

ATE_FUN.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

D R A F T

ATE_IND Independent testing

Objectives

405 The objective is to demonstrate that the security functions perform as specified.

406 An additional objective is to counter the risk of an incorrect assessment of the test outcomes on the part of the developer which results in the incorrect implementation of the specifications, or overlooks code that is non-compliant with the specifications.

Component levelling

407 Levelling is based upon the amount of test documentation, test support and the amount of evaluator testing.

Application notes

408 The testing specified in this family can be supported by a party with specialised knowledge other than the evaluator (e.g. an independent laboratory, an objective consumer organisation). Testing requires an understanding of the TOE consistent with the performance of other assurance activities, and the evaluator retains responsibility for ensuring that the requirements of this family are properly addressed when such support it used.

409 This family deals with the degree to which there is independent functional testing of the TSF. Independent functional testing may take the form of repeating the developer's functional tests, in whole or in part. It may also take the form of the augmentation of the developer's functional tests, either to extend the scope or the depth of the developer's tests. These activities are complementary, and an appropriate mix must be planned for each TOE, which takes into account the availability and coverage of test results, and the functional complexity of the TSF. A test plan should be developed which is consistent with the level of other assurance activities, and which, as greater assurance is required, includes larger samples of repeated tests, and more independent positive and negative functional tests by the evaluator.

410 Sampling of developer tests is intended to provide confirmation that the developer has carried out his planned test program on the TSF, and has correctly recorded the results. The size of sample selected will be influenced by the detail and quality of the developer's functional test results. The evaluator will also need to consider the scope for devising additional tests, and the relative benefit which may be gained from effort in these two areas. It is recognised that repetition of all developer tests may be feasible and desirable in some cases, but may be very arduous and less productive in others. The highest component in this family should therefore be used with caution. Sampling will address the whole range of tests results available, including those supplied to meet the requirements of both ATE_COV and ATE_DPT.

411 There is also a need to consider different configurations of the TOE which are included within the evaluation. The evaluator will need to assess the applicability of the results provided, and to plan his own testing accordingly.

412 Independent functional testing is distinct from penetration testing, the latter being based on an informed and systematic search for vulnerabilities in the design. Penetration testing is specified using the family AVA_VLA.

ATE_IND.1 Independent testing - conformance

Objectives

413 In this component, the objective is to demonstrate that the security functions perform as specified.

Application notes

414 The suitability of the TOE for testing is based on the access to the TOE, and the supporting documentation and information required (including any test software or tools) to run tests. The need for such support is addressed by the dependencies to other assurance families.

415 Additionally, suitability of the TOE for testing may be based on other considerations e.g. the version of the TOE submitted by the developer is not the final version.

Dependencies:

ADV_FSP.1 Informal functional specification

AGD_USR.1 User guidance

AGD_ADM.1 Administrator guidance

Developer action elements:

ATE_IND.1.1D **The developer shall provide the TOE for testing.**

Content and presentation of evidence elements:

ATE_IND.1.1C **The TOE shall be suitable for testing.**

Evaluator action elements:

ATE_IND.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

ATE_IND.1.2E **The evaluator shall test the TSF to confirm that the TSF operates as specified.**

D R A F T

ATE_IND.2 Independent testing - sample

Objectives

416 The objective is to demonstrate that the security functions perform as specified.

417 In this component, the objective is to support evaluator testing by selecting and repeating a sample of the developer testing.

Application notes

418 The suitability of the TOE for testing is based on the access to the TOE, and the supporting documentation and information required (including any test software or tools) to run tests. The need for such support is addressed by the dependencies to other assurance families.

419 Additionally, suitability of the TOE for testing may be based on other considerations (e.g. the version of the TOE submitted by the developer is not the final version).

420 The intent is that the developer should provide the evaluator with materials necessary for the efficient reproduction of developer tests. This may include such things as machine-readable test documentation, test programs, etc.

421 The developer is required to perform testing and to provide test documentation and test results. This is addressed by the ATE_FUN family.

422 Testing may be selective and shall be based upon all available documentation.

Dependencies:

ADV_FSP.1 Informal functional specification

AGD_USR.1 User guidance

AGD_ADM.1 Administrator guidance

ATE_FUN.1 Functional testing

Developer action elements:

ATE_IND.2.1D The developer shall provide the TOE for testing.

Content and presentation of evidence elements:

ATE_IND.2.1C The TOE shall be suitable for testing.

ATE_IND.2.2C **The developer shall provide an equivalent set of resources to those that were used in the developer's functional testing of the TSF.**

Evaluator action elements:

ATE_IND.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ATE_IND.2.2E The evaluator shall test the TSF to confirm that the TSF operates as specified.

ATE_IND.2.3E **The evaluator shall execute a sample of tests in the test documentation to verify the developer test results.**

ATE_IND.3 Independent testing - complete

Objectives

423 The objective is to demonstrate that all security functions perform as specified.

424 In this component, the objective is to support evaluator testing by repeating all of the developer testing.

Application notes

425 The suitability of the TOE for testing is based on the access to the TOE, and the supporting documentation and information required (including any test software or tools) to run tests. The need for such support is addressed by the dependencies to other assurance families.

426 Additionally, suitability of the TOE for testing may be based on other considerations (e.g. the version of the TOE submitted by the developer is not the final version).

427 The developer is required to perform testing and to provide test documentation and test results. This is addressed by the ATE_FUN family.

428 Repetition of all of the developer tests forms part of the evaluator test programme.

Dependencies:

ADV_FSP.1 Informal functional specification

AGD_USR.1 User guidance

AGD_ADM.1 Administrator guidance

ATE_FUN.1 Functional testing

Developer action elements:

ATE_IND.3.1D The developer shall provide the TOE for testing.

Content and presentation of evidence elements:

ATE_IND.3.1C The TOE shall be suitable for testing.

D R A F T

ATE_IND.3.2C The developer shall provide an equivalent set of resources to those that were used in the developer's functional testing of the TSF.

Evaluator action elements:

ATE_IND.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ATE_IND.3.2E The evaluator shall test the TSF to confirm that the TSF operates as specified.

ATE_IND.3.3E The evaluator shall execute **all** tests in the test documentation to verify the developer test results.

D R A F T

D R A F T

Class AVA

Vulnerability assessment

429 The class addresses the existence of exploitable covert channels, the possibility of misuse or incorrect configuration of the TOE, the possibility to defeat probabilistic or permutational mechanisms, and the definition and assessment of penetration tests to check whether vulnerabilities introduced in the development or the operation of the TOE can be exploited.

430 Figure 5.8 shows the families within this class, and the hierarchy of components within the families.

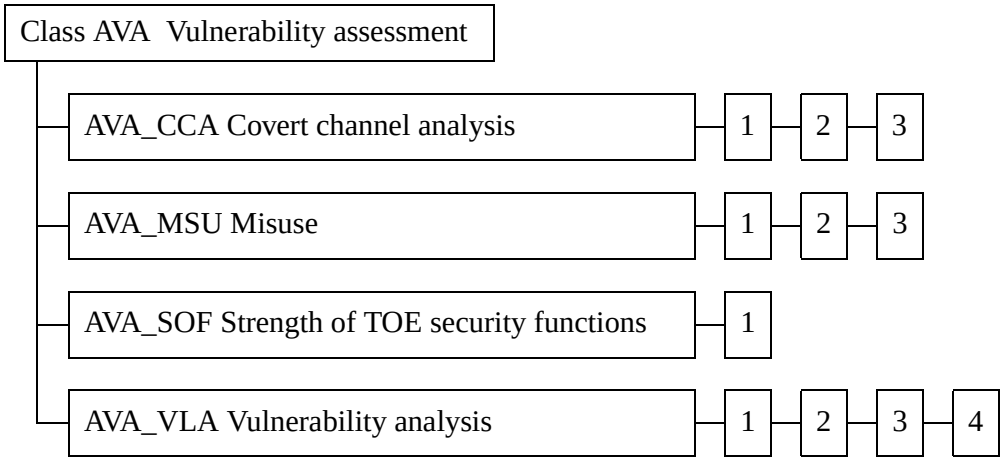

Figure 5.8 -Vulnerability assessment class decomposition

D R A F T

AVA_CCA Covert channel analysis

Objectives

431 Covert channel analysis is carried out to determine the existence and potential capacity of unintended signalling channels that may be exploited by malicious code.

432 The assurance requirements address the threat that unintended and exploitable signalling paths exist which may be exercised to violate the security policy.

Component levelling

433 The components are levelled on increasing rigour of covert channel analysis.

Application notes

434 Channel capacity estimations are based upon informal engineering measurements, as well as actual test measurements.

435 Examples of assumptions upon which the covert channel analysis is based may include: processor speed, system or network configuration, memory size, and cache size.

436 The selective validation of the covert channel analysis through testing allows the evaluator the opportunity to verify any aspect of the covert channel analysis (e.g. identification, capacity estimation, elimination, monitoring, and exploitation scenarios). This does not impose a requirement to demonstrate the entire set of covert channel analysis results.

437 If there are no information flow control policies in the ST, this family of assurance requirements is no longer applicable, since this family applies only to information flow control policies.

AVA_CCA.1 Covert channel analysis

Objectives

438 The objective is to identify covert channels which are identifiable through analysis.

439 In this component, the objective is to perform informal search for covert channels.

Dependencies:

ADV_FSP.1 Informal functional specification

ADV_IMP.2 Implementation of the TSF

AGD_ADM.1 Administrator guidance

AGD_USR.1 User guidance

D R A F T

Developer action elements:

AVA_CCA.1.1D **The developer shall conduct a search for covert channels for each information flow control policy.**

AVA_CCA.1.2D **The developer shall provide covert channel analysis documentation.**

Content and presentation of evidence elements:

AVA_CCA.1.1C **The analysis documentation shall identify covert channels.**

AVA_CCA.1.2C **The analysis documentation shall describe the procedures used for determining the existence of covert channels, and the information needed to carry out the covert channel analysis.**

AVA_CCA.1.3C **The analysis documentation shall describe all assumptions made during the covert channel analysis.**

AVA_CCA.1.4C **The analysis documentation shall describe the method used for estimating channel capacity, which shall be based on worst case scenarios.**

AVA_CCA.1.5C **The analysis documentation shall describe the worst case exploitation scenario for each identified covert channel.**

Evaluator action elements:

AVA_CCA.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

AVA_CCA.1.2E **The evaluator shall confirm that the results of the covert channels analysis meet the functional requirements.**

AVA_CCA.1.3E **The evaluator shall selectively validate the covert channel analysis through testing.**

AVA_CCA.2 Systematic covert channel analysis

Objectives

440 The objective is to identify covert channels which are identifiable through analysis.

441 In this component, the objective is to perform a systematic search for covert channels.

Application notes

442 Performing a covert channel analysis in a systematic way requires that the developer identify covert channels in a structured and repeatable way, as opposed to identifying covert channels in an ad-hoc fashion.

Dependencies:

ADV_FSP.1 Informal functional specification

ADV_IMP.2 Implementation of the TSF

AGD_ADM.1 Administrator guidance

AGD_USR.1 User guidance

Developer action elements:

AVA_CCA.2.1D The developer shall conduct a search for covert channels for each information flow control policy.

AVA_CCA.2.2D The developer shall provide covert channel analysis documentation.

Content and presentation of evidence elements:

AVA_CCA.2.1C The analysis documentation shall identify covert channels.

AVA_CCA.2.2C The analysis documentation shall describe the procedures used for determining the existence of covert channels, and the information needed to carry out the covert channel analysis.

AVA_CCA.2.3C The analysis documentation shall describe all assumptions made during the covert channel analysis.

AVA_CCA.2.4C The analysis documentation shall describe the method used for estimating channel capacity, which shall be based on worst case scenarios.

AVA_CCA.2.5C The analysis documentation shall describe the worst case exploitation scenario for each identified covert channel.

AVA_CCA.2.6C **The analysis documentation shall provide evidence that the method used to identify covert channels is systematic.**

Evaluator action elements:

AVA_CCA.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

AVA_CCA.2.2E The evaluator shall confirm that the results of the covert channels analysis meet the functional requirements.

AVA_CCA.2.3E The evaluator shall selectively validate the covert channel analysis through testing.

AVA_CCA.3 Exhaustive covert channel analysis

Objectives

443 The objective is to identify covert channels which are identifiable through analysis.

D R A F T

444 In this component, the objective is to perform an exhaustive search for covert channels.

Application notes

445 Performing a covert channel analysis in an exhaustive way requires that additional evidence be provided that the plan which was followed for identifying covert channels is sufficient to ensure that all possible ways for covert channel exploration have been exercised.

Dependencies:

ADV_FSP.1 Informal functional specification

ADV_IMP.2 Implementation of the TSF

AGD_ADM.1 Administrator guidance

AGD_USR.1 User guidance

Developer action elements:

AVA_CCA.3.1D The developer shall conduct a search for covert channels for each information flow control policy.

AVA_CCA.3.2D The developer shall provide covert channel analysis documentation.

Content and presentation of evidence elements:

AVA_CCA.3.1C The analysis documentation shall identify covert channels.

AVA_CCA.3.2C The analysis documentation shall describe the procedures used for determining the existence of covert channels, and the information needed to carry out the covert channel analysis.

AVA_CCA.3.3C The analysis documentation shall describe all assumptions made during the covert channel analysis.

AVA_CCA.3.4C The analysis documentation shall describe the method used for estimating channel capacity, which shall be based on worst case scenarios.

AVA_CCA.3.5C The analysis documentation shall describe the worst case exploitation scenario for each identified covert channel.

AVA_CCA.3.6C The analysis documentation shall provide evidence that the method used to identify covert channels is **exhaustive**.

Evaluator action elements:

AVA_CCA.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

AVA_CCA.3.2E The evaluator shall confirm that the results of the covert channels analysis meet the functional requirements.

AVA_CCA.3.3E The evaluator shall selectively validate the covert channel analysis through testing.

D R A F T

AVA_MSU Misuse

Objectives

446 Misuse investigates whether the TOE can be configured or used in a manner which is insecure but which an administrator or end-user of the TOE would reasonably believe to be secure.

447 The objectives are:

a) to minimise the probability of configuring or installing the TOE in a way which is insecure, without the end user or administrator being able to detect it;

b) to minimise the risk of human or other errors in operation which may deactivate, disable, or fail to activate security functions, resulting in an undetected insecure state.

Component levelling

448 The components are levelled on the increasing evidence to be provided by the developer and the increasing rigour of analysis.

Application notes

449 Conflicting, misleading, incomplete or unreasonable guidance may result in a user of the TOE believing that the TOE is secure when it is not, and can result in vulnerabilities.

450 An example of conflicting guidance would be two guidance instructions which imply different outcomes when the same input is supplied.

451 An example of misleading guidance would be the description of a single guidance instruction which could be parsed in more than one way, one of which may result in an insecure state.

452 An example of one guidance completeness aspect would be referencing all assertions of dependencies on external security measures, such as external procedural, physical and personnel controls.

453 An example of unreasonable guidance would be a recommendation to follow a procedure which imposed an unduly onerous administrative burden.

454 Guidance documentation is required. This may be contained in existing User or Administration documentation, or may be provided separately. If provided separately the evaluators should confirm that the documentation is supplied with the TOE.

D R A F T

AVA_MSU.1 Examination of guidance

Objectives

455 The objective is to ensure that misleading, unreasonable and conflicting guidance is absent from the guidance documentation, and that secure procedures for all modes of operation have been addressed. Insecure states should be easy to detect.

Dependencies:

ADO_IGS.1 Installation, generation, and start-up procedures

AGD_ADM.1 Administrator guidance

AGD_USR.1 User guidance

Developer action elements:

AVA_MSU.1.1D **The developer shall provide guidance documentation.**

Content and presentation of evidence elements:

AVA_MSU.1.1C **The guidance documentation shall identify all possible modes of operation of the TOE, including operation following failure or operational error, their consequences and implications for maintaining secure operation.**

AVA_MSU.1.2C **The guidance documentation shall be complete and contain no misleading, conflicting or unreasonable guidance.**

AVA_MSU.1.3C **The guidance documentation shall list all assumptions about the intended environment.**

AVA_MSU.1.4C **The guidance documentation shall list all requirements for external security measures (including external procedural, physical and personnel controls).**

Evaluator action elements:

AVA_MSU.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

AVA_MSU.1.2E **The evaluator shall repeat all configuration and installation procedures to check that the TOE can be configured and used securely using only the supplied guidance documentation.**

AVA_MSU.1.3E **The evaluator shall determine that the use of the guidance documentation allows all insecure states to be detected.**

D R A F T

AVA_MSU.2 Validation of analysis

Objectives

456 The objective is to ensure that misleading, unreasonable and conflicting guidance is absent from the guidance documentation, and that secure procedures for all modes of operation have been addressed. Insecure states should be easy to detect. In this component, an analysis of the guidance documentation by the developer is required to provide additional assurance that the objective has been met.

Dependencies:

ADO_IGS.1 Installation, generation, and start-up procedures

AGD_ADM.1 Administrator guidance

AGD_USR.1 User guidance

Developer action elements:

AVA_MSU.2.1D The developer shall provide guidance documentation**.**

AVA_MSU.2.2D **The developer shall document an analysis of the guidance documentation.**

Content and presentation of evidence elements:

AVA_MSU.2.1C The guidance documentation shall identify all possible modes of operation of the TOE, including operation following failure or operational error, their consequences and implications for maintaining secure operation.

AVA_MSU.2.2C The developer shall ensure that the guidance documentation contains no misleading, conflicting or unreasonable guidance.

AVA_MSU.2.3C The guidance documentation shall list all assumptions about the intended environment.

AVA_MSU.2.4C The guidance documentation shall list all requirements for external security measures (including external procedural, physical and personnel controls).

AVA_MSU.2.5C **The developer's analysis documentation shall demonstrate that the guidance documentation is complete.**

Evaluator action elements:

AVA_MSU.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

AVA_MSU.2.2E The evaluator shall repeat all configuration and installation procedures, **and other procedures selectively**, to check that the TOE can be configured and used securely using only the supplied guidance documentation.

AVA_MSU.2.3E The evaluator shall determine that the use of the guidance documentation allows all insecure states to be detected.

AVA_MSU.2.4E **The evaluator shall confirm that the analysis shows that guidance is provided for secure operation in all modes of operation of the TOE.**

AVA_MSU.3 Analysis and testing for insecure states

Objectives

457 The objective is to ensure that misleading, unreasonable and conflicting guidance is absent from the guidance documentation, and that secure procedures for all modes of operation have been addressed. Insecure states should be easy to detect. In this component, an analysis of the guidance documentation by the developer is required to provide additional assurance that the objective has been met, and this analysis is validated and confirmed through testing by the evaluators.

Application notes

458 In this component the evaluator is required to undertake testing to ensure that if and when the TOE enters an insecure state this may easily be detected. This testing may be considered as a specific aspect of penetration testing.

Dependencies:

ADO_IGS.1 Installation, generation, and start-up procedures

AGD_ADM.1 Administrator guidance

AGD_USR.1 User guidance

Developer action elements:

AVA_MSU.3.1D The developer shall provide guidance documentation**.**

AVA_MSU.3.2D The developer shall document an analysis of the guidance documentation.

Content and presentation of evidence elements:

AVA_MSU.3.1C The guidance documentation shall identify all possible modes of operation of the TOE, including operation following failure or operational error, their consequences and implications for maintaining secure operation.

AVA_MSU.3.2C The developer shall ensure that the guidance documentation contains no misleading, conflicting or unreasonable guidance.

AVA_MSU.3.3C The guidance documentation shall list all assumptions about the intended environment.

AVA_MSU.3.4C The guidance documentation shall list all requirements for external security measures (including external procedural, physical and personnel controls).

D R A F T

AVA_MSU.3.5C The developer's analysis documentation shall demonstrate that the guidance documentation is complete.

Evaluator action elements:

AVA_MSU.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

AVA_MSU.3.2E The evaluator shall repeat all configuration and installation procedures, and other procedures selectively, to check that the TOE can be configured and used securely using only the supplied guidance documentation.

AVA_MSU.3.3E The evaluator shall determine that the use of the guidance documentation allows all insecure states to be detected.

AVA_MSU.3.4E The evaluator shall confirm that the analysis shows that guidance is provided for secure operation in all modes of operation of the TOE.

AVA_MSU.3.5E **The evaluator shall perform independent testing to confirm that the TOE cannot be configured and operated in a manner which is insecure, and which an administrator or end-user, with an understanding of the guidance documentation, would reasonably believe to be secure.**

D R A F T

AVA_SOF Strength of TOE security functions

Objectives

459 Even if a TOE security function cannot be bypassed, deactivated, or corrupted, it may still be possible to defeat it because there is a vulnerability in the concept of its underlying security mechanisms. For those functions a qualification of their security behaviour can be made using the results of a quantitative or statistical analysis of the security behaviour of these mechanisms and the effort required to overcome them. The qualification is made in the form of a strength of TOE security functions claim.

Component levelling

460 There is only one component in this family.

Application notes

461 Security functions are implemented by security mechanisms. For example, a password mechanism can be used in the implementation of the identification and authentication security function.

462 The strength of TOE security functions evaluation is performed at the level of the security mechanism, but its results provide knowledge about the ability of the related security function to counter the identified threats.

463 The strength of TOE security function analysis should consider at least the contents of all the TOE deliverables, including the ST, for the targeted evaluation assurance level.

AVA_SOF.1 Strength of TOE security function evaluation

Dependencies:

ADV_FSP.1 Informal functional specification

ADV_HLD.1 Descriptive high-level design

Developer action elements:

AVA_SOF.1.1D **The developer shall perform a strength of TOE security function analysis for each mechanism identified in the ST as having a strength of TOE security function claim.**

Content and presentation of evidence elements:

AVA_SOF.1.1C **For each mechanism with a strength of TOE security function claim the strength of TOE security function analysis shall show that it meets or exceeds the minimum strength level defined in the PP/ST.**

AVA_SOF.1.2C **For each mechanism with a specific strength of TOE security function claim the strength of TOE security function analysis shall show that it meets or exceeds the specific strength of function metric defined in the PP/ST.**

Evaluator action elements:

AVA_SOF.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

AVA_SOF.1.2E **The evaluator shall confirm that the strength claims are correct.**

D R A F T

AVA_VLA Vulnerability analysis

Objectives

464 Vulnerability analysis is an assessment to determine whether vulnerabilities identified, during the evaluation of the construction and anticipated operation of the TOE or e.g. by flaw hypotheses, could allow malicious users to violate the TSP.

465 Vulnerability analysis deals with the threats that a malicious user will be able to discover flaws that will allow access to resources (e.g. data), allow the ability to interfere with or alter the TSF, or interfere with the authorised capabilities of other users.

Component levelling

466 Levelling is based on an increasing rigour of vulnerability analysis by the evaluator.

Application notes

467 The developer is required to document the disposition of identified vulnerabilities to allow the evaluator to make use of that information if it is found useful as a support for the evaluator's independent vulnerability analysis.

468 The vulnerability analysis should consider at least the contents of all the TOE deliverables including the ST for the targeted evaluation assurance level.

469 Obvious vulnerabilities are those that allow common attacks or those that might be suggested by the TOE interface description. Obvious vulnerabilities include those in the public domain, details of which should be known to a developer or available from an evaluation authority.

470 Obvious penetration attacks are those which are open to exploitation which requires a minimum of understanding of the TOE, skill, technical sophistication, and resources.

471 Independent vulnerability analysis is based on highly detailed technical information. The attacker is assumed to be thoroughly familiar with the specific implementation of the TOE. The attacker is presumed to have a high level of technical sophistication.

472 Performing a search for vulnerabilities in a systematic way requires that the developer identify those vulnerabilities in a structured and repeatable way, as opposed to identifying them in an ad-hoc fashion.

473 The evidence identifies all the TOE documentation upon which the search for flaws was based.

D R A F T

AVA_VLA.1 Developer vulnerability analysis

Objectives

474 A vulnerability analysis is performed by the developer to ascertain the presence of security vulnerabilities.

475 The objective is to confirm that no obvious security vulnerabilities can be exploited in the intended environment for the TOE.

Application notes

476 The evaluator should consider performing additional tests as a result of potential exploitable vulnerabilities identified during other parts of the evaluation.

Dependencies:

ADV_FSP.1 Informal functional specification

ADV_HLD.1 Descriptive high-level design

AGD_ADM.1 Administrator guidance

AGD_USR.1 User guidance

Developer action elements:

AVA_VLA.1.1D **The developer shall perform and document an analysis of the TOE deliverables searching for obvious ways in which a user can violate the TSP.**

AVA_VLA.1.2D **The developer shall document the disposition of identified vulnerabilities.**

Content and presentation of evidence elements:

AVA_VLA.1.1C **The evidence shall show, for all obvious vulnerabilities, that the vulnerability cannot be exploited in the intended environment for the TOE.**

Evaluator action elements:

AVA_VLA.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

AVA_VLA.1.2E **The evaluator shall conduct penetration testing, building on the developer vulnerability analysis, to ensure obvious vulnerabilities have been addressed.**

AVA_VLA.2 Independent vulnerability analysis

Objectives

477 A vulnerability analysis is performed by the developer to ascertain the presence of security vulnerabilities.

D R A F T

478 The objective is to confirm that no identified security vulnerabilities can be exploited in the intended environment for the TOE.

479 An independent vulnerability analysis is performed by the evaluator, which goes beyond the "obvious" security vulnerabilities. The analysis considers the deliverables available for the targeted evaluation assurance level.

Dependencies:

ADV_FSP.1 Informal functional specification

ADV_HLD.2 Security enforcing high-level design

ADV_IMP.1 Subset of the implementation of the TSF

ADV_LLD.1 Descriptive low-level design

AGD_ADM.1 Administrator guidance

AGD_USR.1 User guidance

Developer action elements:

AVA_VLA.2.1D The developer shall perform and document an analysis of the TOE deliverables searching for **ways** in which a user can violate the TSP.

AVA_VLA.2.2D The developer shall document the disposition of identified vulnerabilities.

Content and presentation of evidence elements:

AVA_VLA.2.1C The evidence shall show, for all **identified** vulnerabilities, that the vulnerability cannot be exploited in the intended environment for the TOE.

AVA_VLA.2.2C **The documentation shall justify that the TOE, with the identified vulnerabilities, is resistant to obvious penetration attacks**.

Evaluator action elements:

AVA_VLA.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

AVA_VLA.2.2E The evaluator shall conduct penetration testing, building on the developer vulnerability analysis, to ensure **the identified** vulnerabilities have been addressed.

AVA_VLA.2.3E **The evaluator shall perform an independent vulnerability analysis.**

AVA_VLA.2.4E **The evaluator shall perform independent penetration testing, based on the independent vulnerability analysis, to determine the exploitability of additional identified vulnerabilities in the target environment.**

AVA_VLA.2.5E **The evaluator shall determine that the TOE is resistant to obvious penetration attacks.**

AVA_VLA.3 Relatively resistant

Objectives

480 A vulnerability analysis is performed by the developer to ascertain the presence of security vulnerabilities.

481 The objective is to confirm that no identified security vulnerabilities can be exploited in the intended environment for the TOE.

482 An independent vulnerability analysis is performed by the evaluator, which goes beyond the “obvious” security vulnerabilities. The analysis considers the deliverables available for the targeted evaluation assurance level.

483 In addition, the independent vulnerability analysis performed by the evaluator is based on analytical techniques which are employed to discover vulnerabilities that would require sophisticated attackers.

484 The TOE must be shown to be relatively resistant to penetration attack.

Dependencies:

ADV_FSP.1 Informal functional specification

ADV_HLD.2 Security enforcing high-level design

ADV_IMP.1 Subset of the implementation of the TSF

ADV_LLD.1 Descriptive low-level design

AGD_USR.1 User guidance

Content and presentation of evidence elements:

AVA_VLA.3.1D The developer shall perform and document an analysis of the TOE deliverables searching for ways in which a user can violate the TSP.

AVA_VLA.3.2D The developer shall document the disposition of identified vulnerabilities.

Content and presentation of evidence elements:

AVA_VLA.3.1C The evidence shall show, for all identified vulnerabilities, that the vulnerability cannot be exploited in the intended environment for the TOE.

AVA_VLA.3.2C The documentation shall justify that the TOE, with the identified vulnerabilities, is resistant to obvious penetration attacks.

AVA_VLA.3.3C **The evidence shall show that the search for vulnerabilities is systematic.**

Evaluator action elements:

AVA_VLA.3.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

AVA_VLA.3.2E The evaluator shall conduct penetration testing, building on the developer vulnerability analysis, to ensure the identified vulnerabilities have been addressed.

AVA_VLA.3.3E The evaluator shall perform an independent vulnerability analysis.

AVA_VLA.3.4E The evaluator shall perform independent penetration testing, based on the independent vulnerability analysis, to determine the exploitability of additional identified vulnerabilities in the target environment.

AVA_VLA.3.5E The evaluator shall determine that the TOE is **relatively** resistant to penetration attacks.

AVA_VLA.4 Highly resistant

Objectives

485 A vulnerability analysis is performed by the developer to ascertain the presence of "obvious" security vulnerabilities.

486 The objective is to confirm that no identified security vulnerabilities can be exploited in the intended environment for the TOE.

487 An independent vulnerability analysis is performed by the evaluator, which goes beyond the "obvious" security vulnerabilities. The analysis considers the deliverables available for the targeted evaluation assurance level.

488 In addition, the independent vulnerability analysis performed by the evaluator is based on analytical techniques which are employed to discover vulnerabilities that would require sophisticated attackers.

489 The TOE must be shown to be highly resistant to penetration attacks.

Dependencies:

ADV_FSP.1 Informal functional specification

ADV_HLD.2 Security enforcing high-level design

ADV_IMP.1 Subset of the implementation of the TSF

ADV_LLD.1 Descriptive low-level design

AGD_ADM.1 Administrator guidance

AGD_USR.1 User guidance

Developer action elements:

AVA_VLA.4.1D The developer shall perform and document an analysis of the TOE deliverables searching for ways in which a user can violate the TSP.

AVA_VLA.4.2D The developer shall document the disposition of identified vulnerabilities.

Content and presentation of evidence elements:

AVA_VLA.4.1C The evidence shall show, for all identified vulnerabilities, that the vulnerability cannot be exploited in the intended environment for the TOE.

AVA_VLA.4.2C The documentation shall justify that the TOE, with the identified vulnerabilities, is resistant to obvious penetration attacks.

AVA_VLA.4.3C The evidence shall show that the search for vulnerabilities is systematic.

AVA_VLA.4.4C **The analysis documentation shall provide a justification that the analysis completely addresses the TOE deliverables.**

Evaluator action elements:

AVA_VLA.4.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

AVA_VLA.4.2E The evaluator shall conduct penetration testing, building on the developer vulnerability analysis, to ensure the identified vulnerabilities have been addressed.

AVA_VLA.4.3E The evaluator shall perform an independent vulnerability analysis.

AVA_VLA.4.4E The evaluator shall perform independent penetration testing, based on the independent vulnerability analysis, to determine the exploitability of additional identified vulnerabilities in the target environment.

AVA_VLA.4.5E The evaluator shall determine that the TOE is **highly** resistant to penetration attacks.

D R A F T

Chapter 6

Maintenance assurance paradigm

490 ***Editor Note: At a late stage in the production of this version of the document it was agreed that the material in this particular chapter had to be split. The refinement of the text (e.g. eliminating redundancy) could not be completed by the meeting end-date and will therefore continue. However, the technical approach in the chapter is not expected to change.***

6.1 Introduction

491 This chapter provides the discourse on the assurance maintenance paradigm which is implemented in the Maintenance of assurance class (AMA).

492 Maintenance of assurance is a concept to be applied after a TOE has been evaluated and certified against the criteria in chapters 3 and 5. The maintenance assurance requirements are aimed at assuring that the TOE will continue to meet its security target as changes are made to the TOE or its environment. Such changes include the discovery of new threats or vulnerabilities, changes in user requirements, and the correction of bugs found in the certified TOE.

493 One way of determining that assurance has been maintained is by a re-evaluation of the TOE, i.e. an evaluation of the new version of the TOE that addresses all security relevant changes made to the certified version of the TOE. However, the requirements of class AMA are intended to be applied where there is a need for confidence that the assurance established in a TOE is being maintained, but where formal re-evaluation of every new version of the TOE is not considered to be a practical option.

494 Maintenance developer and evaluator actions need to be applied *after* the TOE has been evaluated and certified although, as described below, some requirements can be applied at the time of the evaluation. For clarity, the following terms are used in this paradigm description:

a) the *certified version* of the TOE refers to the version that has been evaluated and certified (in combination with any hardware or software platforms that are identified in the ST);

b) the *current version* of the TOE refers to a version that differs in some respect from the certified version; this could be, for example:

- a new release of the TOE
- the certified version with patches applied to correct subsequently discovered bugs

- the same basic version of the TOE, but on a different hardware or software platform.

495 The developer and evaluator roles in this class are as described in Part 1 of the criteria. However, not all developer and evaluator actions in this class relate specifically to the evaluated and certified version of the TOE; as such, it is not necessarily the case that the evaluator referred to in the requirements of this class will be the same organisation as that which evaluated the certified version of the TOE.

496 In order to allow assurance to be maintained in a TOE without always requiring a formal re-evaluation, the requirements in this class place an onus on the developer maintaining evidence which shows that the TOE continues to satisfy its security target.

6.2 Maintenance cycle

497 The paradigm is one of a 'maintenance cycle' that may be divided into the following three phases:

a) the *acceptance phase*, at the start of a cycle, in which the developer's plans and procedures for assurance maintenance during the cycle are established by the developer and independently validated by an evaluator;

b) the *monitoring phase*, in which the developer provides at one or more points during the cycle evidence that the assurance in the TOE is being maintained in accordance with the established plans and procedures, this evidence being independently checked by an evaluator;

c) the *re-evaluation phase*, completing the cycle, in which an updated version of the TOE is submitted for a re-evaluation based on the changes affecting the TOE since the certified version.

498 These phases are introduced here simply to help describe the application of the assurance maintenance requirements. There is no intention to mandate an assurance maintenance scheme which formally incorporates these phases.

499 The maintenance cycle is illustrated in Figure 6.1 below.

500 In this paradigm, a TOE can only enter the monitoring phase once the acceptance phase has been successfully concluded, i.e. the developer's plans and procedures for assurance maintenance have been accepted. If the developer makes changes to these plans or procedures during the monitoring phase then the TOE must re-enter the acceptance phase to get the changes accepted.

501 During the monitoring phase the developer follows the assurance maintenance plans and procedures, conducting an analysis of the security impact of changes affecting the TOE. At certain points during this phase, an evaluator independently checks (by means of an audit) the developer's work. The developer is required to

ensure that the plans and procedures are followed, and that security impact analysis is performed correctly.

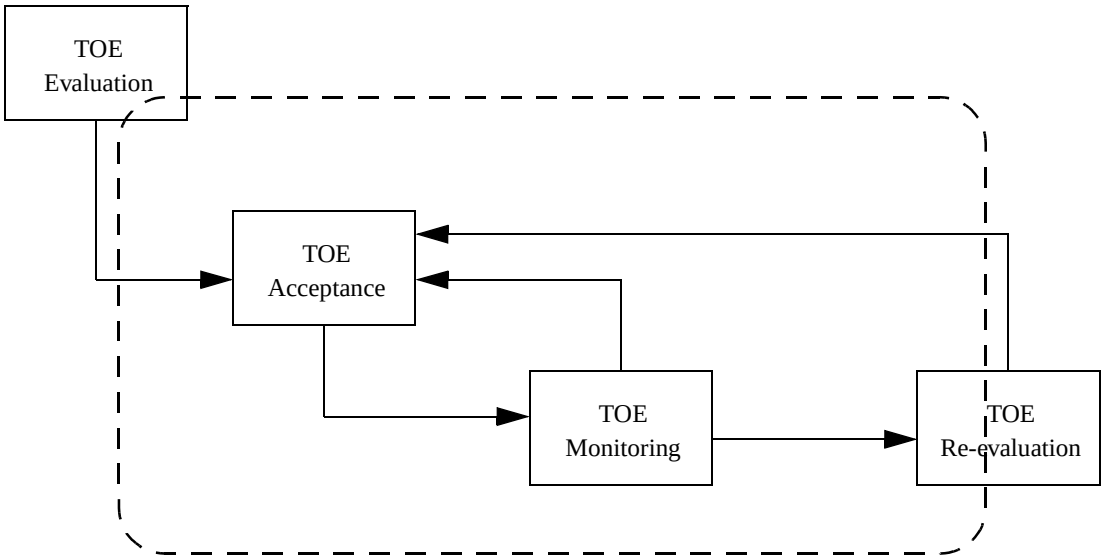

Figure 6.1 - Assurance maintenance cycle

502 Therefore, once a TOE is in the monitoring phase, it becomes possible to have confidence that the assurance in the TOE has been maintained for new versions of the TOE produced by the developer.

503 A TOE that is subject to change may not continue in the monitoring phase for an indefinite period: at some point a re-evaluation of the TOE will be necessary. The decision as to when a re-evaluation is required is dependent on cumulative changes to the TOE as well as especially significant changes. For example, a large number of minor changes could have an impact on assurance equivalent to that of a major change. The developer's assurance maintenance plan defines the scope of the changes that may be made to the TOE during the monitoring phase.

504 In a similar way, it is not possible to 'uprate' a TOE (i.e. increase the assurance level) during the monitoring phase: this can only be achieved by means of an evaluation of the TOE (making appropriate reuse of previous evaluation results).

505 A TOE may also have to exit from the monitoring phase if it is discovered that the assurance maintenance plans are not being followed, and that as a result assurance in the TOE is undermined. In some cases the developer may be required to submit the TOE for re-evaluation before starting a new maintenance cycle.

506 It should be noted that the requirements defined in the AMA class do not preclude re-evaluation of a TOE on an 'ad-hoc' basis; in other words, a TOE can still be re-evaluated against these criteria without any of the AMA requirements having been

D R A F T

satisfied. However, the effort required for such an ‘ad-hoc’ re-evaluation of a TOE can be reduced if the developer can provide analysis of changes using the families in this class.

6.2.1 TOE acceptance

507 The TOE acceptance phase of the Maintenance assurance refines into the following which uses the Assurance maintenance plan and TOE component categorisation report families from the AMA class.

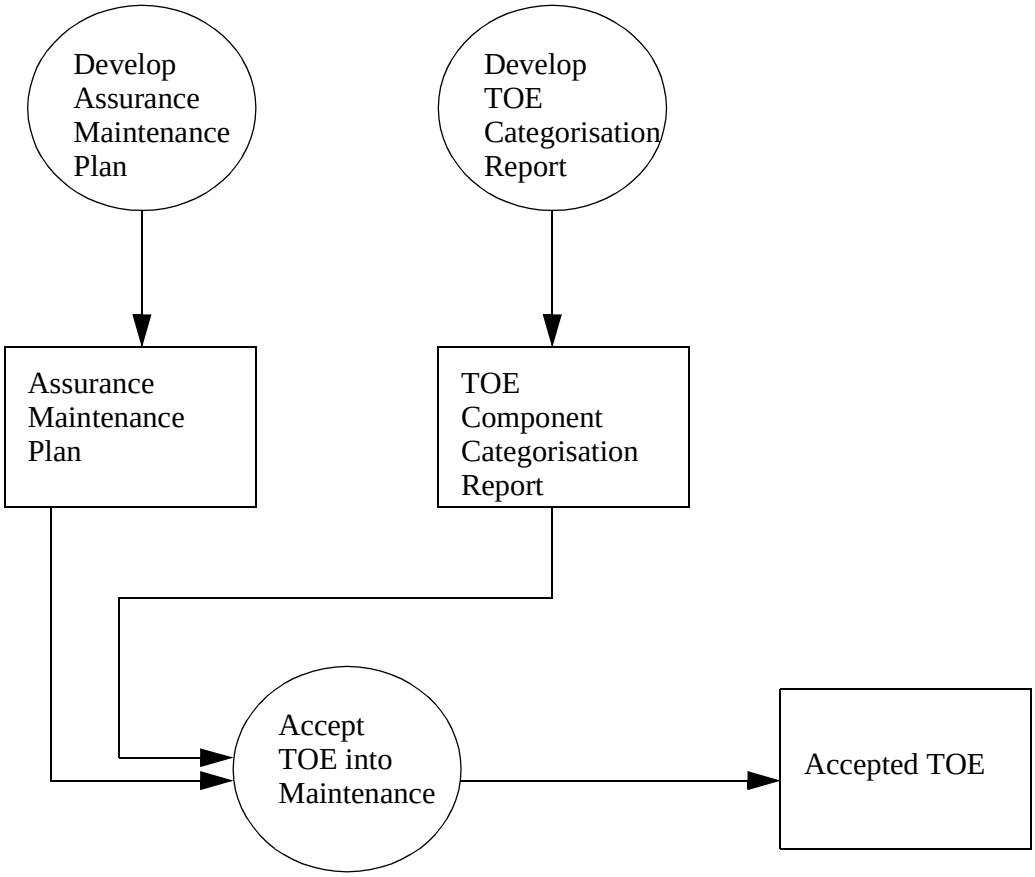

Figure 6.2 - TOE acceptance

D R A F T

6.2.2 TOE monitoring

508 The TOE monitoring phase of the Maintenance assurance refines into the following which uses the Evidence of assurance maintenance and Security impact analysis families of the AMA Class.

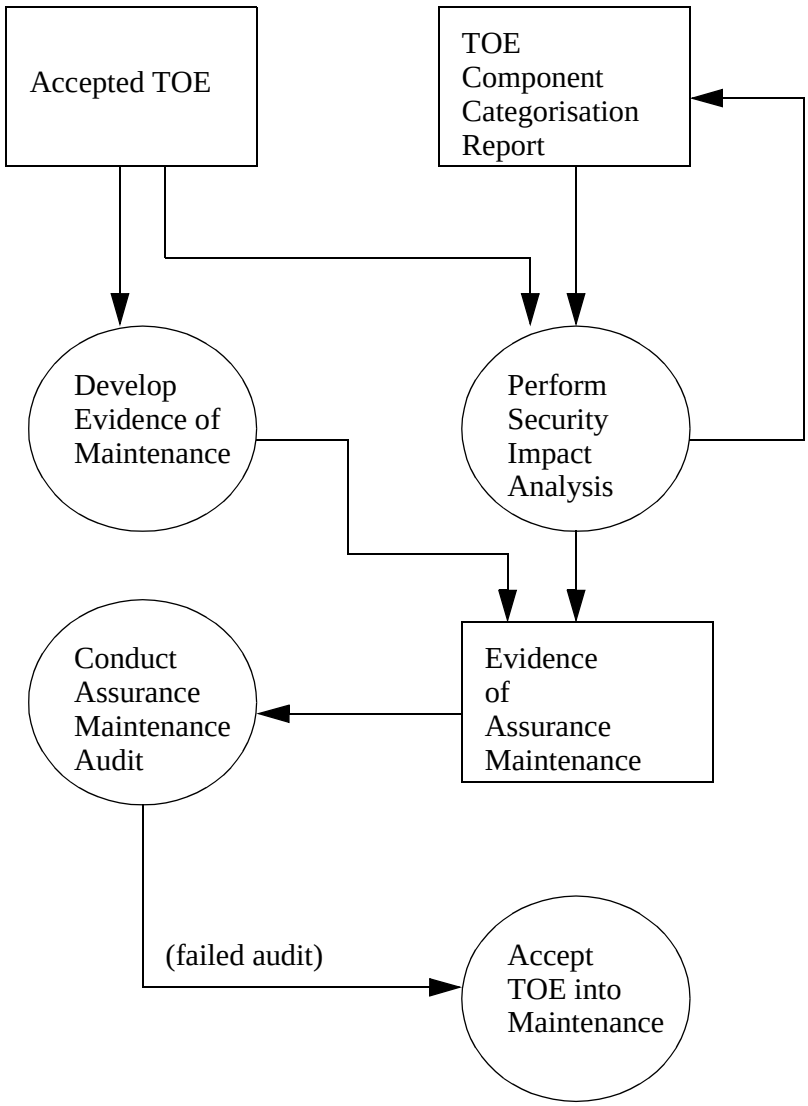

Figure 6.3 - TOE monitoring

D R A F T

6.3 Maintenance assurance class and families

509 To support the Maintenance assurance paradigm, the class AMA which comprises four families as shown in Table 6.1 has been developed

Assurance Class	Assurance Family	Abbreviated Name
Maintenance of assurance	Assurance maintenance plan	AMA_AMP
	TOE component categorisation report	AMA_CAT
	Evidence of assurance maintenance	AMA_EVD
	Security impact analysis	AMA_SIA

Table 6.1 - Maintenance of assurance family breakdown and mapping

6.3.1 Assurance maintenance plan

510 The assurance maintenance plan identifies the plans and procedures a developer must implement in order to ensure that the assurance that was established in the certified TOE is maintained as changes are made to the TOE or its environment.

511 An assurance maintenance plan covers one *maintenance cycle*, this being the period from the completion of the most recent evaluation of the TOE to the completion of the next planned re-evaluation.

512 The assurance maintenance plan provides a clear identification of the baseline for assurance maintenance, in terms of the evaluation results and the definition of the categorisation of TOE components.

513 The general principles are that the following types of change are always outside the scope of the assurance maintenance plan and thus can only be addressed by means of a re-evaluation:

a) significant changes to the security target (i.e. significant changes to the security environment, security objectives or security functional requirements, or *any* increase in the assurance requirements);

b) significant changes to external TSF interfaces categorised as TSP enforcing;

c) (where the assurance requirements include ADV_HLD.1 or higher components) significant changes to TSF subsystems categorised as TSP enforcing.

514 A more precise specification of the rules is outside the scope of these criteria, not least because the definition of what constitutes a *significant* change will be dependent on the type of TOE evaluated, and on the content of the security target.

515 The assurance maintenance plan is required to define or reference the procedures that will be applied to ensure that assurance in the TOE is maintained during the maintenance cycle. Four types of procedure are identified, which should always be applied:

a) Configuration management procedures, controlling and recording changes to the TOE in support of the developer's security impact analysis, as well as supporting documentation (including the AM Plan itself).

b) Procedures to maintain 'assurance evidence', i.e. the maintenance of documentary evidence as required by the appropriate assurance requirements. A key aspect of this is functional testing of the security functions of the TOE, and the developer's regression testing policy in particular.

c) Procedures governing the security impact analysis of changes affecting the TOE. Note that this includes changes within the TOE environment, such as new threats or attack methods which may need to be identified and tracked. The procedures also cover the maintenance of the TOE categorisation report as changes are made.

d) Flaw remediation procedures, covering the tracking of reported security flaws, their correction, and the issuing of such corrections to the TOE user community (as required by ALC_FLR.2).

516 The assurance maintenance plan will, by default, remain valid until completion of the maintenance cycle (i.e. completion of the scheduled re-evaluation), after which a new assurance maintenance plan will be required. An assurance maintenance plan will be invalidated if the developer does not follow the plan, or makes changes to the TOE that are outside the scope of the plan, or if it becomes necessary to make such changes in order for the TOE to remain effective within its environment. An updated assurance maintenance plan must be re-submitted for acceptance before a TOE may re-enter the monitoring phase.

517 The assurance maintenance plan requires the developer to identify a developer security analyst whose responsibility is to monitor the assurance maintenance process. The role may be filled by more than one individual. The developer security analyst is required to be familiar with the TOE, the evaluation results and applicable assurance requirements as an essential prerequisite for fulfilling the role. The requirements do not specify *how* this level of knowledge and experience should be gained; however, it is likely that a prospective developer security analyst will have to undergo some form of training programme to address any deficiencies in his or her knowledge and experience.

518 The developer security analyst must have sufficient authority within the developer's organisation to ensure that the requirements of the assurance maintenance plan and its associated procedures are followed, so that assurance in the TOE is not compromised. The developer security analyst must also be fully supported by the upper developer management (financially and otherwise) in

implementing the assurance maintenance plan. It is not required that the developer security analyst be otherwise independent of the development team.

519 If the developer security analyst does not have right level of knowledge and experience, or is prevented from fully implementing the assurance maintenance plan, the likely consequence will be a failed assurance maintenance audit leading to removal of the TOE from the monitoring phase.

6.3.2 TOE component categorisation report

520 The aim of the TOE component categorisation report is to complement the AM Plan by providing a categorisation of the components of a TOE (e.g. TSF subsystems) according to their relevance to security. This categorisation acts as a focus for the developer's security impact analysis, and also for the subsequent re-evaluation of the TOE. These requirements are applied during the acceptance phase of the TOE's maintenance cycle.

521 The checking of the TOE component categorisation report occurs during the acceptance phase; the evaluator checks are only applied in respect of the version of the report for the certified version of the TOE. While the assurance maintenance procedures identified in the AM Plan require the developer to update the categorisation report as changes are made to the TOE, any updates made during the monitoring phase do not require checking by the re-application of the AMA_CAT.1 evaluator actions; however, any such updates are likely to be inspected during the AM audits.

522 The term "least abstract TSF representation" in AMA_CAT.1 refers to the least abstract representation of the TSF that was provided for the level of assurance that is being maintained. For example, if the TOE is to be maintained at an assurance level of EAL3, then the least abstract TSF representation is the high-level design, and the following TOE components must be categorised:

a) all external TSF interfaces identifiable in the functional specification;

b) all TSF subsystems identifiable in the high-level design.

523 While AMA_CAT requires at least two categories to be defined, it may be appropriate (dependent on the type of TOE) to further subdivide the TSP enforcing category in order to help focus the developer's security impact analysis. For example, TSP enforcing components could be categorised as either:

a) *security critical*, where the TOE component is *directly* responsible for the enforcement of at least one IT security function defined in the security target; or

b) *security supporting*, where the TOE component is not *directly* responsible for the enforcement of any IT security function, is used to refer to any TOE component that is not in the *security critical* category, but is nonetheless relied upon to uphold the IT security functions; this may include two distinct types of TOE component:

- those that provide services to *security critical* components, and hence are relied upon to function correctly;
- those that do not provide any such service, but which nonetheless have to be trusted not to behave in a malicious manner (i.e. introducing a vulnerability).

524 The TOE component categorisation report should also identify any components that are external to the TOE (e.g. hardware or software platforms) and which must satisfy IT security requirements as defined in the ST.

525 The description of the categorisation scheme required is intended to enable the developer security analyst to decide the category to which any new TOE component should be assigned, and also when to change the category of an existing component following changes to the TOE or its ST. If the simplest categorisation scheme is adopted (i.e. TSP enforcing or non-TSP enforcing), then a statement to this effect is all that is required as a definition of the scheme. However, any TOE-specific details (e.g. architectural boundaries enforced by separation mechanisms) should also be included in the description.

526 The TOE component categorisation report should identify any development tools which, if modified, will have an impact on the assurance that the TOE satisfies its security target. Such tools will have been identified through application of assurance requirements in the ALC_TAT: Tools and techniques family, e.g. the compiler used to create the object code. If the security target does not specify any requirements from this family, then it is likely that no such tools will be identified in the TOE component categorisation report.

527 The initial categorisation of the components of the TOE will be based on evidence provided by the developer in support of the evaluation of the TOE, independently validated by the evaluators. Although maintenance of the document is the responsibility of the developer security analyst, its initial contents may be based on the results of the evaluation of the TOE, without compromising the evaluator's independence.

528 It may be useful for the ST to include this component where there is a requirement that assurance be maintained in future versions of the TOE. This applies irrespective of whether assurance maintenance is to be achieved by application of the requirements in this class, or by periodic 'ad-hoc' re-evaluations of the TOE.The TOE acceptance phase of the Maintenance assurance refines into the following which uses the Assurance maintenance plan and TOE component categorisation report families from the AMA class.

6.3.3 Evidence of assurance maintenance

529 The aim of this family of requirements is to establish confidence that the assurance in the TOE is being maintained by the developer, in accordance with the AM Plan. This is achieved through the provision of evidence which demonstrates that the assurance in the TOE has been maintained, which is independently checked by an evaluator. This check (termed an 'AM audit') is periodically applied during the monitoring phase of the TOE's maintenance cycle.

530 AM audits are conducted in accordance with the schedule defined in the AM Plan. The developer and evaluator actions required by AMA_EVD.1 will therefore be invoked one or more times during the monitoring phase of the maintenance cycle. The evaluators may need to visit the TOE development environment to examine the required evidence, but other ways of performing the checks are not precluded.

531 AMA_EVD.1 requires the provision of evidence that the assurance maintenance procedures in the AM Plan are being followed. This covers all procedures referred to in AMA_AMP.1, and will include evidence such as configuration management records, evidence referenced by the security impact analysis (covering all applicable assurance requirements such as design updates, test documentation, new versions of guidance documents, and so on, as well as the current version of the categorisation report), and evidence of the tracking of security flaws.

532 The evaluator's check of the developer's security impact analysis (required by AMA_SIA.1 on which AMA_EVD.1 depends) will act as a focus for the AM audit. The AM audit will, in turn, provide corroboration of the developer's analysis (and hence confidence in the quality of the analysis), thereby serving to validate the developer's claim that assurance has been maintained in the current version of the TOE.

533 AMA_EVD.1 includes some evidence requirements that are similar to assurance requirements defined in the ACM: Configuration management, ATE : Tests and AVA : Vulnerability assessment classes. However, the AM audit does not require an examination of the evidence to the same extent as required by the components in these classes; rather, it requires a sampling approach to establish confidence that the assurance maintenance procedures are being followed correctly.

534 The evidence requires the provision of a list of identified vulnerabilities in the current version of the TOE. This is highlighted separately because of the importance of ensuring that the current version contains no known vulnerabilities that are exploitable within the TOE environment. This list should include vulnerabilities arising from:

a) the developer's analysis required by AVA_VLA.1 (or higher) components;

b) any other reported security flaws handled by the flaw remediation procedures required byALC_FLR.2.

535 AMA_EVD.1 requires the evaluators to check (by sampling) that the configuration list and security impact analysis are consistent for the current version of the TOE, in terms of the identification of the TOE components which have changed from the certified version of the TOE.

536 AMA_EVD.1 requires the evaluators to confirm that functional testing has been performed on the current version of the TOE, commensurate with the level of assurance being maintained. This is highlighted as a separate check because test documentation provides firm evidence that the TOE security functions continue to operate as specified, and thus merits a more detailed examination than other documentary evidence. The evaluators should therefore sample the test

documentation to confirm that the developer testing addresses all relevant requirements in the coverage (ATE_COV), depth (ATE_DPT) and functional tests (ATE_FUN) families.

6.3.4 Security impact analysis

537 The aim of the security impact analysis is to provide confidence that assurance has been maintained in the TOE, through an analysis performed by the developer of the security impact of all changes affecting the TOE since it was certified. These requirements may be applied during either the monitoring phase or the re-evaluation phase.

538 The developer's security impact analysis is based on the TOE component categorisation report: changes to TSP enforcing components may have an impact on the assurance that the TOE continues to meet its ST following the changes. All such changes therefore require an analysis of their security impact to show that they do not undermine assurance in the TOE.

539 The components in this family may be used in support of either a subsequent AM audit or a re-evaluation of the TOE.

540 For an AM audit, the evaluators' review of the security impact analysis will act as a focus for the subsequent audit activities, which in turn will provide corroboration of the developer's analysis. In some cases, a sampling approach (as required by AMA_SIA.1) may be sufficient to establish confidence that assurance has been maintained in the current version of the TOE. In other cases, AMA_SIA.2 may be preferred where a sampling approach is not considered sufficient, but where a formal re-evaluation is not required. The decision as to which component should be selected in a given scenario is beyond the scope of these criteria.

541 Both components in this family require the security impact analysis to identify the new and modified TOE components in the current version of the TOE (as compared with the certified version). The accuracy of this information will be checked during either the associated AM audit (by sampling), or the associated re-evaluation of the TOE (when the configuration list is checked under ACM_CAP).

542 Provision of the security impact analysis in support of a re-evaluation will reduce the level of evaluator effort needed to establish the required level of assurance in the TOE. Application of AMA_SIA.2, which requires a full examination of the security impact analysis, is likely to provide maximum benefit to the re-evaluation. The precise detailed conditions under which a national evaluation authority might wish the security impact analysis to be used in practice in a re-evaluation are beyond the scope of these criteria

D R A F T

Class AMA

Maintenance of assurance

543 The maintenance of assurance class provides requirements that are to be applied after a TOE has been certified against the CC. These requirements are aimed at maintaining the level of assurance that the TOE will continue to meet its security target as changes are made to the TOE or its environment. Such changes include the discovery of new threats or vulnerabilities, changes in user requirements, and the correction of bugs found in the certified TOE.

544 The class comprises four families, and the hierarchy of components within, as shown in Figure 6.4:

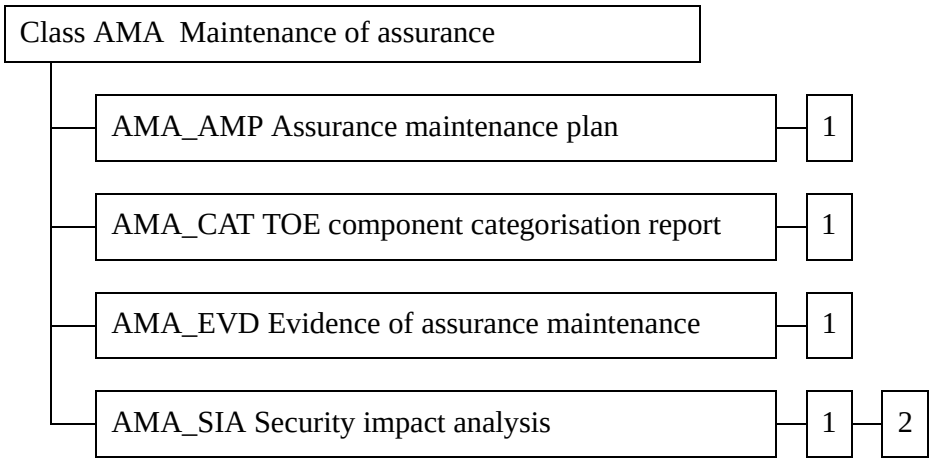

Figure 6.4 - Maintenance of assurance class decomposition

545 Each of the families in this class identify developer and evaluator actions which are to be applied *after* the TOE has been evaluated and certified although, as described below, some requirements can be applied at the time of the evaluation. For clarity, the following terms are used in this class:

a) the *certified version* of the TOE refers to the version that has been evaluated and certified;

b) the *current version* of the TOE refers to a version that differs in some respect from the certified version.

D R A F T

AMA_AMP Assurance maintenance plan

Objectives

546 The Assurance Maintenance Plan (AM Plan) identifies the plans and procedures a developer must implement in order to ensure that the assurance that was established in the certified TOE is maintained as changes are made to the TOE or its environment. The AM Plan is specific to the TOE, and is tailored to the developer's own practices and procedures. These requirements are applied during the acceptance phase of the TOE's maintenance cycle.

Component levelling

547 This family contains only one component.

Application notes

548 An AM Plan covers one *maintenance cycle*, this being the period from the completion of the most recent evaluation of the TOE to the completion of the next planned re-evaluation.

549 The requirements AMA_AMP.1.2C and AMA_AMP.1.3C serve to provide a clear identification of the baseline for assurance maintenance, in terms of the evaluation results and the definition of the categorisation of TOE components. The TOE component categorisation report is subject to the requirements of the AMA_CAT family, and provides the basis for the security impact analysis performed by the developer security analyst.

550 The definition of the scope of changes covered by the plan, as required by AMA_AMP.1.4C, should be in terms of the category of components of the TOE that may be changed and the representational level at which changes can occur (referencing the TOE component categorisation report where appropriate).

551 AMA_AMP.1.5C requires a description of the developer's *current* plans for any new releases of the TOE. These plans may be subject to change, and hence require an update to the AM Plan. It should be noted, however, that in this context the term *new release* does not, for example, include minor ('unplanned') releases of the TOE to incorporate bug fixes.

552 AMA_AMP.1.6C requires a definition of the planned schedule for AM audits (see the AMA_EVD family below) and the targeted re-evaluation of the TOE, together with a justification of the proposed schedules. The schedules may be defined in terms of elapsed time (e.g. annual AM audits), or they may be linked to specific new releases of the TOE. The planned schedules should take into account the expected changes to the TOE during the period, and also any elapsed period between the evaluation of the TOE and the establishment of the AM Plan. In particular, any changes outside the scope of the AM Plan will trigger a re-evaluation.

553 AMA_AMP.1.9C requires a definition of or reference to the procedures that will be applied to ensure that assurance in the TOE is maintained during the maintenance cycle. Four types of procedure are identified, which should always be applied.

AMA_AMP.1 Assurance maintenance plan

Dependencies:

ACM_CAP.1 Version numbers

ALC_FLR.2 Flaw reporting procedures

ATE_IND.1 Independent testing - conformance

Developer action elements:

AMA_AMP.1.1D **The developer shall provide an AM Plan.**

Content and presentation of evidence elements:

AMA_AMP.1.1C **The AM Plan shall contain or reference a brief description of the TOE, including the security functionality it provides.**

AMA_AMP.1.2C **The AM Plan shall identify the certified version of the TOE, and shall reference the evaluation results.**

AMA_AMP.1.3C **The AM Plan shall reference the TOE component categorisation report for the certified version of the TOE.**

AMA_AMP.1.4C **The AM Plan shall define the scope of changes to the TOE that are covered by the plan.**

AMA_AMP.1.5C **The AM Plan shall describe the TOE life-cycle, and shall identify the current plans for any new releases of the TOE, together with a brief description of any planned changes that are likely to have a significant security impact.**

AMA_AMP.1.6C **The AM Plan shall describe the assurance maintenance cycle, stating and justifying the planned schedule of AM audits and the target date of the next re-evaluation of the TOE.**

AMA_AMP.1.7C **The AM Plan shall identify the individual(s) who will assume the role of developer security analyst for the TOE, and shall describe how the role will ensure that the procedures documented or referenced in the AM Plan are followed, and that all developer actions involved in the analysis of the security impact of changes affecting the TOE are performed correctly.**

AMA_AMP.1.8C **The AM Plan shall justify why the identified developer security analyst(s) have sufficient familiarity with the security target, functional specification and (where appropriate) high-level design of the TOE, and with the evaluation**

results and all applicable assurance requirements for the certified version of the TOE.

AMA_AMP.1.9C **The AM Plan shall describe or reference the procedures to be applied to maintain the assurance in the TOE, which as a minimum shall include the procedures for: configuration management, maintenance of assurance evidence, performance of the analysis of the security impact of changes affecting the TOE, and flaw remediation.**

Evaluator action elements:

AMA_AMP.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

AMA_AMP.1.2E **The evaluator shall confirm that the proposed schedules for AM audits and re-evaluation of the TOE are acceptable and consistent with the proposed changes to the TOE.**

D R A F T

AMA_CAT TOE component categorisation report

Objectives

554 The aim of the TOE component categorisation report is to complement the AM Plan by providing a categorisation of the components of a TOE (e.g. TSF subsystems) according to their relevance to security. This categorisation acts as a focus for the developer's security impact analysis, and also for the subsequent re-evaluation of the TOE. These requirements are applied during the acceptance phase of the TOE's maintenance cycle.

Component levelling

555 This family contains only one component.

Application notes

556 The term "least abstract TSF representation" in AMA_CAT.1.1 refers to the least abstract representation of the TSF that was provided for the level of assurance that is being maintained. For example, if the TOE is to be maintained at an assurance level of EAL3, then the least abstract TSF representation is the high-level design, and the following TOE components must be categorised:

a) all external TSF interfaces identifiable in the functional specification;

b) all TSF subsystems identifiable in the high-level design.

557 While AMA_CAT requires at least two categories to be defined, it may be appropriate (dependent on the type of TOE) to further subdivide the TSP enforcing category in order to help focus the developer's security impact analysis. For example, TSP enforcing components could be categorised as either:

a) *security critical*, where the TOE component is *directly* responsible for the enforcement of at least one IT security function defined in the security target; or

b) *security supporting*, where the TOE component is not *directly* responsible for the enforcement of any IT security function, is used to refer to any TOE component that is not in the *security critical* category, but is nonetheless relied upon to uphold the IT security functions.

558 The TOE component categorisation report should also identify any components that are external to the TOE (e.g. hardware or software platforms) and which must satisfy IT security requirements as defined in the ST.

559 AMA_CAT.1.3C requires an identification of any development tools which, if modified, will have an impact on the assurance that the TOE satisfies its security target.

D R A F T

AMA_CAT.1 TOE component categorisation report

Dependencies:

ACM_CAP.1 Version numbers

Developer action elements:

AMA_CAT.1.1D **The developer shall provide a TOE component categorisation report for the certified version of the TOE.**

Content and presentation of evidence elements:

AMA_CAT.1.1C **The TOE component categorisation report shall categorise each component of the TOE, identifiable in each TSF representation from the most abstract to the least abstract, according to its relevance to security; as a minimum, TOE components must be categorised as one of *TSP enforcing* or *non-TSP enforcing*.**

AMA_CAT.1.2C **The TOE component categorisation report shall describe the categorisation scheme used, so that it can be determined how to categorise new components introduced into the TOE, and also when to re-categorise existing TOE components following changes to the TOE or its security target.**

AMA_CAT.1.3C **The TOE component categorisation report shall identify any tools used in the development environment that are relevant to security.**

Evaluator action elements:

AMA_CAT.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

AMA_CAT.1.2E **The evaluator shall confirm that the categorisation of TOE components and tools, and the categorisation scheme used, are appropriate and consistent with the evaluation results for the certified version.**

D R A F T

AMA_EVD Evidence of assurance maintenance

Objectives

560 The aim of this family of requirements is to establish confidence that the assurance in the TOE is being maintained by the developer, in accordance with the AM Plan. This is achieved through the provision of evidence which demonstrates that the assurance in the TOE has been maintained, which is independently checked by an evaluator. This check, termed an 'AM audit', is periodically applied during the monitoring phase of the TOE's maintenance cycle.

Component levelling

561 This family contains only one component.

Application notes

562 AMA_EVD.1.3C requires the provision of evidence that the assurance maintenance procedures in the AM Plan are being followed. This covers all procedures referred to in AMA_AMP.1.9C, and will include evidence such as configuration management records, evidence referenced by the security impact analysis (covering all applicable assurance requirements such as design updates, test documentation, new versions of guidance documents, and so on, as well as the current version of the categorisation report), and evidence of the tracking of security flaws.

563 AMA_EVD.1.4C requires the provision of a list of identified vulnerabilities in the current version of the TOE. This is highlighted separately because of the importance of ensuring that the current version contains no known vulnerabilities that are exploitable within the TOE environment. This list should include vulnerabilities arising from:

a) the developer's analysis required by AVA_VLA.1, or higher component;

b) any other reported security flaws handled by the flaw remediation procedures required by ALC_FLR.2.

564 AMA_EVD.1.5E requires the evaluators to confirm that functional testing has been performed on the current version of the TOE, commensurate with the level of assurance being maintained. This is highlighted as a separate check because test documentation provides evidence that the TOE security functions continue to operate as specified. The evaluators should therefore sample the test documentation to confirm that the developer testing addresses all relevant requirements in the coverage (ATE_COV), depth (ATE_DPT) and functional tests (ATE_FUN) families.

AMA_EVD.1 Evidence of maintenance process

Dependencies:

AMA_AMP.1 Assurance maintenance plan

D R A F T

AMA_SIA.1 Sampling of security impact analysis

Developer action elements:

AMA_EVD.1.1D **The developer security analyst shall provide AM documentation for the current version of the TOE.**

Content and presentation of evidence elements:

AMA_EVD.1.1C **The AM documentation shall include a configuration list and a list of identified vulnerabilities in the TOE.**

AMA_EVD.1.2C **The configuration list shall describe the configuration items that comprise the current version of the TOE.**

AMA_EVD.1.3C **The AM documentation shall provide evidence that the procedures documented or referenced in the AM Plan are being followed.**

AMA_EVD.1.4C **The list of identified vulnerabilities in the current version of the TOE shall show, for each vulnerability, that the vulnerability cannot be exploited in the intended environment for the TOE.**

Evaluator action elements:

AMA_EVD.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

AMA_EVD.1.2E **The evaluator shall confirm that the procedures documented or referenced in the AM Plan are being followed.**

AMA_EVD.1.3E **The evaluator shall check by sampling that the security impact analysis for the current version of the TOE is consistent with the configuration list.**

AMA_EVD.1.4E **The evaluator shall confirm that all changes documented in the security impact analysis for the current version of the TOE are within the scope of changes covered by the AM Plan, and that the AM Plan is still valid.**

AMA_EVD.1.5E **The evaluator shall confirm that functional testing has been performed on the current version of the TOE, to a degree commensurate with the level of assurance being maintained.**

D R A F T

AMA_SIA Security impact analysis

Objectives

565 The aim of the security impact analysis is to provide confidence that assurance has been maintained in the TOE, through an analysis performed by the developer of the security impact of all changes affecting the TOE since it was certified. These requirements may be applied during either the monitoring phase or the re-evaluation phase.

Component levelling

566 This family consists of two components, levelled according to the degree to which an evaluator validates the developer's security impact analysis.

Application notes

567 The developer's security impact analysis is based on the TOE component categorisation report: changes to TSP enforcing components may have an impact on the assurance that the TOE continues to meet its ST following the changes. All such changes therefore require an analysis of their security impact to show that they do not undermine assurance in the TOE.

568 In some cases, a sampling approach as required by AMA_SIA.1 may be sufficient to establish confidence that assurance has been maintained in the current version of the TOE. In other cases, AMA_SIA.2 may be preferred where a sampling approach is not considered sufficient, but where a formal re-evaluation is not required.

569 Both components in this family require the security impact analysis to identify the new and modified TOE components in the current version of the TOE (as compared with the certified version). The accuracy of this information will be checked during either the associated AM audit (by sampling), or the associated re-evaluation of the TOE when the configuration list is checked under ACM_CAP.

AMA_SIA.1 Sampling of security impact analysis

Dependencies:

AMA_CAT.1 TOE component categorisation report

Developer action elements:

AMA_SIA.1.1D **The developer security analyst shall, for the current version of the TOE, provide a security impact analysis that covers all changes affecting the TOE as compared with the certified version.**

Content and presentation of evidence elements:

AMA_SIA.1.1C **The security impact analysis shall identify the certified TOE from which the current version of the TOE was derived, and shall identify all new and modified TOE components that are categorised as TSP enforcing.**

AMA_SIA.1.2C **The security impact analysis shall, for each change affecting the security target or TSF representations, briefly describe the change and any effects it has on lower representation levels.**

AMA_SIA.1.3C **The security impact analysis shall, for each change affecting the security target or TSF representations, identify all IT security functions and all TOE components categorised as TSP enforcing that are affected by the change.**

AMA_SIA.1.4C **The security impact analysis shall, for each change which results in a modification of the implementation representation of the TSF or the IT environment, identify the test evidence that shows, to the required level of assurance, that the TSF continues to be correctly implemented following the change.**

AMA_SIA.1.5C **The security impact analysis shall, for each applicable assurance requirement in the configuration management (ACM) and life cycle support (ALC) assurance classes, identify any evaluation deliverables that have changed, and provide a brief description of each change and its impact on assurance.**

AMA_SIA.1.6C **The security impact analysis shall, for each applicable assurance requirement in the delivery and operation (ADO) and guidance documents (AGD) assurance classes, identify any evaluation deliverables that have changed, and provide a brief description of each change and its impact on assurance.**

AMA_SIA.1.7C **The security impact analysis shall, for each applicable assurance requirement in the vulnerability assessment (AVA) assurance class, identify which evaluation deliverables have changed and which have not, and give reasons for the decision taken as to whether or not to update the deliverable. These justifications shall be by reference to the documented changes affecting the security target, development or operational deliverables.**

Evaluator action elements:

AMA_SIA.1.1E **The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.**

AMA_SIA.1.2E **The evaluator shall check, by sampling, that the security impact analysis documents changes to an appropriate level of detail, together with appropriate justifications that assurance has been maintained in the current version of the TOE.**

D R A F T

AMA_SIA.2 Examination of security impact analysis

Dependencies:

AMA_CAT.1 TOE component categorisation report

Developer action elements:

AMA_SIA.2.1D The developer security analyst shall, for the current version of the TOE, provide a security impact analysis that covers all changes affecting the TOE as compared with the certified version.

Content and presentation of evidence elements:

AMA_SIA.2.1C The security impact analysis shall identify the certified TOE from which the current version of the TOE was derived, and shall identify all new and modified TOE components that are categorised as TSP enforcing.

AMA_SIA.2.2C The security impact analysis shall, for each change affecting the security target or TSF representations, briefly describe the change and any effects it has on lower representation levels.

AMA_SIA.2.3C The security impact analysis shall, for each change affecting the security target or TSF representations, identify all IT security functions and all TOE components categorised as TSP enforcing that are affected by the change.

AMA_SIA.2.4C The security impact analysis shall, for each change which results in a modification of the implementation representation of the TSF or the IT environment, identify the test evidence that shows, to the required level of assurance, that the TSF continues to be correctly implemented following the change.

AMA_SIA.2.5C The security impact analysis shall, for each applicable assurance requirement in the configuration management (ACM) and life cycle support (ALC) assurance classes, identify any evaluation deliverables that have changed, and provide a brief description of each change and its impact on assurance.

AMA_SIA.2.6C The security impact analysis shall, for each applicable assurance requirement in the delivery and operation (ADO) and guidance documents (AGD) assurance classes, identify any evaluation deliverables that have changed, and provide a brief description of each change and its impact on assurance.

AMA_SIA.2.7C The security impact analysis shall, for each applicable assurance requirement in the vulnerability assessment (AVA) assurance class, identify which evaluation deliverables have changed and which have not, and give reasons for the decision taken as to whether or not to update the deliverable. These justifications shall be by reference to the documented changes affecting the security target, development or operational deliverables.

D R A F T

Evaluator action elements:

AMA_SIA.2.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

AMA_SIA.2.2E The evaluator shall check that the security impact analysis documents **all** changes to an appropriate level of detail, together with appropriate justifications that assurance has been maintained in the current version of the TOE.

D R A F T

Annex A

Cross reference of assurance component dependencies

570 The dependencies documented in the components in Chapter 5 are the direct dependencies between the assurance components. Table A.1 summarises both the direct dependencies and the indirect dependencies. The indirect dependencies are the cumulative result of iteratively including all the dependencies of each component identified as being a dependency.

Table A.1 -Assurance component dependencies[a]

a. In Table A.1, the left column represents groupings of specific components (using only the last three digits of the component name and an indicator of component number or range of numbers). Each non-empty box in the table indicates a specific component, identified by its name at the top of the column and the number in the box, on which the component in the left column is dependent. Bold numbers represent direct dependencies. Italicised numbers represent indirect dependencies. Dark shading represents the intersection of a component with itself. Dependencies from AMA components to assurance components are included in Table A.1, while AMA internal dependencies are shown in Table A.2 below.

Table B.1 -Evaluation Assurance Level Summary

D R A F T

Annex C

CC observation report (CCOR)

C.1 Introduction

573 The CC sponsoring organisations welcome feedback from the community and are particularly interested in observations and comments arising out of application of the criteria.

574 The CC sponsoring organisations have set up a body to coordinate and learn from the community experience and to ensure that future issues of the CC can benefit from that experience.

575 Comments, observations, and requests for interpretations should be sent to one of the addresses listed inside the front cover of the CC. If you require feedback on a specific evaluation matter, you should use the contact address which corresponds to the evaluation authority concerned.

C.2 Format of observation report

576 In order to allow for the automated categorisation of the observations, a standard observation format is needed.

577 The following provides a description of each structure of the required comment format and an example of a comment in the required format.

578 If you are submitting one or more observations by electronic mail or other machine readable format, you must use the ASCII text format to guarantee that your submission can be process by an automated tool. You must also insert the tags defined below, each starting in the first column, as this will greatly assist in the automated handling of your input.

579 Each observation report should consist of three parts.

a) The first part consists of a tags **$1:** to **$4:**, which includes the information to allow the unique identification of the originator. This first set of tags is required only once per single observation or batch of observations.

b) The second part consists of tags **$5:** to **$9:**, which includes the information to allow the unique identification and categorisation of the observation, the actual observation itself and suggested solution. The text of each observation should extend to as many lines as are needed to fully express the observation. There can be one or more observations in an observation report.

The set of tags **$5:** to **$9:**, comprising this second part of the observation report, should be repeated for each observation being submitted.

c) The third part consists of a single terminating tag **$$:**. This final tag is required only once per single observation or batch of observations.

C.2.1 Tag definitions for observation report

580 Each tag must start at the first column of a new line.

$1: Originator name

581 The characters "**$1:**" without the quotation marks, followed on the same line by the name of commenter (only required once per message).

$2: Originator organisation

582 The characters "**$2:**" without the quotation marks, followed on the same line by the originator organisation/affiliation (only required once per message).

$3: Return address

583 The characters "**$3:**" without the quotation marks, followed on the same line by the electronic mail or other address for response (only required once per message).

$4: Date

584 The characters "**$4:**" without the quotation marks, followed on the same line by the submission date of observation (only required once per message). The date should be formatted as:

YYMMDD

where YY refers to the last two digits of the calendar year, MM refers to the two digit representation of the month, and DD refers to the two digit representation of the day. For example, 29 December 1997 should be formatted as:

971229

and 5 January 1998 should be formatted as:

980105

$5: Originator report reference identification

585 The characters "**$5:**" without the quotation marks, followed on the same line by the reference for observation which is unique to originator. Please include your initials or similar unique discriminator, e.g. ABC1234.

$6: One line summary/title of observation

586 The characters "**$6:**" without the quotation marks, followed on the same line by the short summary/title for problem (up to 60 characters).

D R A F T

$7: CC document reference

587 The characters "**$7:**" without the quotation marks, followed on the same line by the single reference to the affected area of the CC as detailed as appropriate. The CC version for which the comment is being provided is required. Where possible, part number, section, paragraph, class, family, component, or requirement reference should be provided.

588 The template for CC document reference is as follows:

$7: Version / Part / Document Identifier / Keyword

589 The CC document reference template should be completed as follows (see below for completed example):

a) The characters "**$7:**" without the quotation marks, to indicate the start of an observation.

b) Identification of the Version. The CC Version can be found on the title page of each CC Part. It can also be found in the footer of every internal page within each Part. Some examples are:

Version 1.0
Version 2.0
Version 2.0 Beta
Version 2.0 Draft

c) A "/" character, without the quotes, should be inserted between the Version and the Part identifiers.

d) Part:
Valid identifiers for the CC Part are:

P1 for Part 1
P1A for Part 1 Annex A
P1B for Part 1 Annex B
P1C for Part 1 Annex C
P1D for Part 1 Annex D
P1E for Part 1 Annex E
P2 for Part 2
P2A for Part 2 Annex A
P3 for Part 3
P3A for Part 3 Annex A
P3B for Part 3 Annex B
P3C for Part 3 Annex C

e) A "/" character, without the quotes, should be inserted between the Part and the Specific Document identifiers.

f) The Specific Document Identifier to which the comment applies in the CC. It should be as specific as is possible. The following list of options is

provided in order of decreasing detail, such that if an option applies to your comment (when checking the options in order) then you should follow the directions within that option. If your comment applies to more than one of the options below, then you should consider following the directions in those additional options to determine other document identifiers and separate the resulting list of document identifiers with a comma.

If the comment refers to something within a paragraph, then that paragraph number should be provided (e.g. 232).

If the comment refers to an element then the complete element identifier should be provided (e.g. FIA_ATD.1.1).

If the comment refers to a component then the complete component identifier should be provided (e.g. ADV_FSP.1). Additionally, any relevant page numbers could also be provided (e.g. 123-123).

If the comment refers to a family then the complete family identifier should be provided (e.g. FAU). Additionally, any relevant page numbers could also be provided (e.g. 123-123).

If the comment refers to a section then the complete section identifier, preceded by the word "Section" should be provided (e.g. Section 3.1.1). Additionally, any relevant page numbers could also be provided (e.g. 123-123).

g) A "/" character, without the quotes, should be inserted between the Specific Document identifier and the Keyword (if a keyword is provided).

h) An optional keyword can be provided if the author of the CCOR feels it would be helpful.

$8: Statement of observation

590 The characters "**$8:**" without the quotation marks, followed on the same (or a new) line by the comprehensive statement of observation or query. This field can span several lines. It must contain the actual text of the observation. It should include specific reference to examples of the observation, where appropriate.

$9: Suggested solution

591 The characters "**$9**" without the quotation marks, followed on the same (or a new) line by the proposed solution or solution approach. This field can span several lines. It should include specific replacement text when possible.

$$: Terminating tag

592 The characters "**$$:**" without the quotation marks. This enables an automated handling system to determine the end of the batch of observations (only required once per batch of observations).

D R A F T

C.2.2 Example observations:

$1: A. N. Other
$2: PPs ‘R’ US
$3: another@ppsrus.com
$4: 980131
$5: ano.comment.1
$6: Presentation comment.
$7: P2 / FDP_ACF.1 / Italicise
$8: The operations in the component FDP_ACF.1 should be italicised.
$9: Italicise the operations.
$5: ano.comment.2
$6: Missing requirement for audit.
$7: P2 / FAU, pg. 336 /
$8: The first sentence of this paragraph is incomplete.
$9: The first sentence should include “imminent” violations.
$$: This is the end tag, the contents are immaterial.
